DEPARTMENT OF THE ARMY FIELD MANUAL

QUARTERMASTER REFERENCE DATA

HEADQUARTERS, DEPARTMENT OF THE ARMY

SEPTEMBER 1957

FIELD MANUAL
No. 10–13

HEADQUARTERS,
DEPARTMENT OF THE ARMY
WASHINGTON 25, D. C., *24 September 1957*

QUARTERMASTER REFERENCE DATA

*This manual supersedes FM 10–13, 15 August 1950.

CHAPTER 1
INTRODUCTION

1. Purpose

This manual provides statistical information and data for use in planning and performing quartermaster operations. It contains logistical reference data on supplies and equipment pertinent to every-day functioning of the Quartermaster Corps.

2. Scope

This manual provides planning data on subsistence, quartermaster general supplies and equipment, petroleum, packaging and crating, transportation, and recovery and disposition activities. The manual also gives measurements, conversions, and equivalents useful to quartermaster activities.

3. Modification

a. Information contained in this manual reflects policies. Policies are subject to modification which results in the publication of changes. Users of this manual are requested to submit recommendations for changes or corrections to the Commanding General, Quartermaster Training Command, Fort Lee, Va. The format for submitting recommended changes is contained in AR 310–3.

b. The material presented herein is applicable without modification to atomic and nonatomic warfare.

4. Classes of Supply

Supplies are all items necessary for the equipment, maintenance, and operation of a military command; supplies include subsistence, clothing, equipment, arms, ammunition, fuel, storage, materials, repair parts, and machinery of all kinds. The following are the classes of supply used by the Department of the Army:

a. Class I Supplies. Supplies, such as rations and forage, which are consumed by humans and animals at an approximate uniform daily rate under all conditions.

b. Class II Supplies. Supplies, such as clothing, weapons, and vehicles, for which allowances are fixed by tables of allowances, tables of organization and equipment, or other issue authorization documents.

c. Class III Supplies. Supplies, such as fuels and lubricants for all purposes except aviation, including gasoline for all vehicles, diesel oil, fuel oil, and coal.

d. Class III (A) Supplies. Aviation fuels and lubricants.

e. Class IV Supplies. Supplies and equipment for which allowances are not prescribed or which are not otherwise classified.

f. Class IV (A) Supplies. Complete airplanes, airplane equipment, and all repair parts and supplies required to maintain a complete airplane.

g. Class V Supplies. Ammunition, pyrotechnics, antitank mines, and chemical warfare agents.

5. Federal Supply Classification System

The Federal Supply Classification (FSC) System divides items of supply into broad commodity groups; each group is subdivided into classes, which cover similar commodities. For example, Group 84, Clothing and Individual Equipment, contains Classes 8405, Men's Outerwear; 8410, Women's Outerwear; 8415, Special Purpose Clothing; and 8420, Men's Underwear and Nightwear. A complete listing of FSC groups and classes is found in SB 708–401, SB 708–402, and SB 708–403.

6. Supply Manuals

Department of the Army supply manuals furnish supply classification codes, identification numbers, category numbers, stock numbers, item names and identifications, units of issue, expendability, illustrations, prices, parts allowances, stockage guide data, cross-references, and other supply operational information required by Army activities to carry out their assigned responsibilities. Each technical service supply manual series lists all items of supply for which the particular technical service is responsible. Quartermaster Corps supply manuals are described and indexed in DA Pam 310–30.

CHAPTER 2
SUBSISTENCE

7. Ration Data

Table I provides information on rations.

Table I. Ration Data

Type	Contents per package or case	Weight per package or case (lbs)	Average weight per ration or packet, including packaging (lbs)	Volume per package or case (cu ft)	Average volume per ration or packet, including packaging (cu ft)	Average calories per ration
Ration, field A[1]	----------	--------	6.0	--------	0.183	4,200
Ration, operational B[2]	----------	--------	6.0	--------	0.127	4,400
Ration, small detachment, 5 persons.[3]	5 rations	28.5	5.8	1.1	0.2	3,600
Ration, combat, individual.[4]	6 rations	38	6.5	1.2	0.2	3,600
Ration, trail, frigid, individual.[5]	8 rations	34	4.0	1.6	0.2	4,400
Ration supplement, spice pack.[6]	----------	47	--------	1.9		
Ration supplement, sundries pack (1 pack per 100 men).[7]	4 rations	24	4.8	.85	--------	3,600
Ration, individual, combat, meal type.	----------	20	--------	1.1		
Ration supplement, aid station (makes 205 8-oz drinks).[8]	24 packets	29	1.1	1.1	--------	800
Food packet, assault, individual.[9]	24 packets	34	1.5	0.7	--------	2,000
Food packet, survival, arctic, SA.[10]	24 packets	36	1.5	0.7	--------	1,700
Food packet, survival, tropic, ST.[11]						

[1] Ration, field A, is the basic field ration. It consists of approximately 200 items, including such perishables as fresh and frozen meats, vegetables, and fruit. It is intended for use primarily under stable conditions and during static phases of military operations when normal cooking and refrigeration facilities are available. It should be issued in preference to any other type of ration whenever it is available and circumstances permit its use. Components, weight, and volume of this ration vary.

[2] Ration, operational B, is designed for use whenever mess facilities and personnel are available and where NO perishable foods are issued. The use of canned or dried items, together with the use of staple items, constitute this ration. Components, weight, and volume of this ration vary. SB 10–495 contains information concerning the breakdown of this ration.

[3] Ration, small detachment, 5 persons, consists of nonperishable precooked food which may be eaten hot. It is intended to be used where organized messing is not possible but when feeding in small groups is possible.

[4] Ration, combat, individual, consists of nonperishable precooked food which may be eaten hot or cold; it is carried and prepared by the individual soldier. This ration is intended for use when the tactical situation is so unstable that messing in small groups is not possible and no kitchen facilities are available.

[5] Ration, trail, frigid, individual, is designed for use in extremely cold climates by small patrols or trail teams under conditions where resupply is impossible.

[6] Ration supplement, spice pack, consists of an assortment of spices, condiments, and leavening agents to supplement 1,000 operational rations B and to provide facility for issue in the field. The spice pack varies in weight and cubage, being tailormade to different situations, to be scaled with the B ration.

[7] Ration supplement, sundries pack, consists of comfort items such as toilet articles, tobacco, and candy, serving as a supplement to operational ration B, for the issue of these items before the establishment of adequate sales facilities.

[8] Ration supplement, aid station, is designed to provide special nourishment in the form of hot stimulating beverages for combat zone casualties at aid and clearing stations.

[9] Food packet, assault, individual, is packaged so that it may be carried by the individual; it is provided troops in the initial assault phase of combat, when food is required that is lightweight, highly palatable, and conveniently carried by the individual. The food packet should not be used for other than the phase of battle for which it is designed—specifically, a period not exceeding 30 hours and during which a soldier cannot receive complete rations through planned resupply.

[10] Food packet, survival, arctic, SA, is designed for survival kits carried aboard aircraft operating over arctic regions. The packets are carried in the emergency kit which forms a part of the ejection seat in modern combat aircraft. Packets are carried in the emergency kits for passengers aboard transport aircraft.

[11] Food packet, survival, tropic, ST, is designed to be carried in survival kits of aircraft operating over tropical regions. The packet is composed of palatable foods of high caloric density to be used only for survival conditions and not as a regular ration.

8. Time Element in Class I Supply

Table II may be used as a guide in estimating the time required to distribute and process rations from the class I distributing point to the using unit. Time elements vary, depending on supply capabilities and type of ration issued.

Table II. Time Element in Class I Supply

Work	Daylight (minutes)	Dark (minutes)
Unloading rations for one division at class I distributing point and preparing for distribution to regiments or separate battalions.	120	150
Distribution of class I supplies to regiment by higher echelon at one distributing point.	30	30
Distribution of class I supplies to separate battalion by higher echelon or similar unit.	15	15
Preparation of 1 day's class I supplies for issue at regimental or battalion class I distributing point.	30	60
Distribution by regimental supply agencies of one field ration (transfer of loads) to kitchens.	15	20
Kitchens to be taken off trucks, set up, and made ready to begin cooking (or vice versa).	20	20
Division of one ration into three meals at kitchens	15	20
Kitchens (starting hot) to cook and prepare for serving a hot meal.	120	150
Kitchens to prepare a cold noon meal, the issue of meal to take place usually coincident with serving of breakfast.	60	90
Serving a hot meal to men from a kitchen truck when majority of men are served at the truck.	45	60
Serving a hot meal to men by means of carrying parties, assuming that kitchen truck is not farther than 1,000 yards in rear of company.	90	120

9. Ration Breakdown Chart

The ration breakdown chart (table III) is useful for making accurate computations of issue. In using the chart, it is recommended that a straightedge or rule be used. For example, assume a ration strength of 2,187 men. One of the items to be issued is evaporated milk at 32 cans per 100 men. Place the lower guide along the line marked 32 on the left. Now take the amount at the intersection of the 2,000 strength column, which is 640; next, at the intersection of 100, which is 32; next at the intersection of 80, which is 25.6; and then, at the intersection of 7, which is 2.24. The total is 699.84 cans, allowance for 2,187 men.

10. Subsistence Storage Data

Table IV may be used as a guide for storage of subsistence in temperate regions.

Amount of issue per one hundred (100) men	1	2	3	4	5	6	7	8	9	10	15	20	25	30	35	40	45	50	55	60	65	70	75	80	85	90	95	100	200	300	400	500	600	700	800	900	1000	2000	3000	4000	5000	6000	7000	8000	9000	10000	11000	12000	13000	14000

Table III. Ration Breakdown Chart

(Strength)

Table IV. Subsistence Storage Data Nonperishables

Item	Unit	Safe storage life	
		70° F.	90° F.
Apples, dehydrated	Can	7–12	3–6
Applesauce	Can	20 to 24	12 to 15
Apricots	Can	20 to 24	12 to 15
Apricots, dried	Carton*	3 to 6	1 to 2
Asparagus	Can	24 to 30	12
Bacon, sliced	Can	18	12
Baking powder	Package*	Indefinite	Indefinite
Beans:			
Kidney, dry	Bag*	30 to 36	18
Lima	Can	30 to 36	18
Snap	Can	30 to 36	18
White, dry	Sack*	30 to 36	18
Beef:			
Corned	Can	36 to 48	24
Roasted	Can	36 to 48	24
Beef and corn	Can	36 to 48	24
Beef and macaroni with cheese sauce	Can	36 to 48	24
Beef and peas with gravy	Can	36 to 48	24
Beef and vegetables	Can	36 to 48	24
Beef with gravy	Can	36 to 48	24
Beets	Can	24 to 36	12 to 15
Beverage base:			
Lemon	Can	48	24
Orange	Can	48	24
Bouillon cubes	Can	24	10 to 12
Bread, white	Can	24	18
Cabbage, dehydrated	Can	7 to 12	5 to 6
Candy:			
Chocolate, ration	Carton*	12 to 36	16 to 18
Hard	Can	36 to 48	18 to 24
Pecan, nut, roll	Can	36 to 48	24
Starch jellies, ration	Carton*	36 to 48	18 to 24
Carrots	Can	30 to 36	18
Catsup, tomato	Can	6 to 12	3 to 6
Cereals:			
Prepared	Carton*	36	24
Wheat, farina	Can	36 to 48	18
Cheese, American, processed	Can	30 to 36	10 to 12
Cherries, red, sour, pitted	Can	7 to 12	3 to 4
Chicken, boned	Can	36 to 48	24
Chicken and noodles	Can	36 to 48	24
Chicken and vegetables	Can	36 to 48	24
Chicken or turkey, boned, solid pack	Can	36 to 48	30 to 36
Chili con carne, without beans	Can	24 to 30	18 to 24
Chili powder	Package*	24	6 to 9

For footnotes see page 11.

Table IV. Subsistence Storage Data Nonperishables—Continued

Item	Unit	Safe storage life	
		70° F.	90° F.
Cinnamon, ground	Container*	24	6 to 9
Cloves, whole	Container*	24	6 to 9
Cocoa:			
Powder	Carton*	36 to 40	18
Sirup	Can	24 to 36	12 to 18
Coffee:			
Green	Sack*	48 to 60	24
Instant	Can	60	30 to 36
Roasted and ground	Bulk*	7 days	3 days
Roasted and ground	Can or Carton*	7 to 12	5 to 6
Cookies:			
Oatmeal with chocolate chips	Can	36 to 48	24
Sandwich type	Can	36	18 to 24
Corn:			
Cream style	Can	12 to 24	7 to 9
Whole grain style	Can	30 to 36	18
Cornmeal	Package*	12 to 18	12
Cornstarch	Package*	Indefinite	Indefinite
Crackers, graham	Package*	20 to 24	10 to 12
Crackers, soda, salted	Package*	20 to 24	10 to 12
Cranberries, dehydrated	Can	7 to 12	3 to 4
Cranberry sauce	Can	18 to 24	9 to 12
Dessert powder:			
Gelatin base	Can	12 to 24	10 to 12
Starch base	Can	36 to 48	18
Eggs, whole, dry	Can	24 to 36	6 to 12
Figs	Can	20 to 24	12 to 15
Figs, dried	Can	10 to 12	5 to 6
Flavoring, imitation:			
Maple	Bottle**	Indefinite	Indefinite
Vanilla	Bottle**	Indefinite	Indefinite
Flour, wheat, hard	Bag*	9 to 12	3 to 4
Frankfurters	Can	18 to 24	18
Frankfurters and beans	Can	36 to 48	24
Fruit cake	Can	36 to 48	18 to 24
Fruit cocktail	Can	20 to 24	12 to 15
Garlic	Container*	24	6 to 9
Grapefruit, segments	Can	7 to 12	3 to 4
Ham, chunks	Can	30	24
Ham, fried	Can	30	24
Ham and eggs, chopped	Can	18 to 24	12 to 18

For footnotes see page 11.

Table IV. Subsistence Storage Data Nonperishables—Continued

Item	Unit	Safe storage life	
		70° F.	90° F.
Ham and kidney beans in sauce	Can	36 to 48	24
Ham and potatoes with gravy	Can	30	24
Hamburgers	Can	36 to 48	24
Horseradish, dehydrated	Jar*	36 to 48	6 to 12
Hot sauce	Jar*	36 to 48	6 to 12
Jam:			
Cherry	Can	12 to 18	5 to 6
Peach	Can	18 to 24	10 to 12
Pineapple	Can	18 to 24	10 to 12
Strawberry	Can	12 to 18	5 to 6
Jelly:			
Blackberry	Can	18 to 24	10 to 12
Crabapple	Can	18 to 24	10 to 12
Grape	Can	18 to 24	10 to 12
Juices:			
Grape	Can	6 to 9	2 to 3
Grapefruit and orange unsweetened	Can	6 to 9	2 to 3
Orange	Can	6 to 9	2 to 3
Pineapple	Can	6 to 9	2 to 3
Tomato	Can	6 to 9	2 to 3
Luncheon meat	Can	30	24
Macaroni	Carton*	18 to 24	10 to 12
Macaroni, spaghetti and vermicelli	Carton*	18 to 24	10 to 12
Malted milk powder	Can	12 to 24	9 to 12
Margarine	Can	24	3 to 12
Marmalade	Can	18 to 24	10 to 12
Meatballs and beans in tomato sauce	Can	24 to 30	18
Meat and noodles	Can	36 to 48	24
Meringue powder	Can	24	12 to 18
Milk, evaporated	Can**	12	6
Milk, product, dry	Can	10 to 12	5 to 6
Milk solids, dry, nonfat	Drum	12 to 24	9 to 12
Monosodium glutamate	Package*	Indefinite	Indefinite
Mustard:			
Ground	Carton*	24	6 to 9
Prepared	Bottle or jar**	18	12
Noodles, egg	Carton*	18 to 24	10 to 12
Nutmeg, ground	Container	24	6 to 9
Onions, dehydrated, sliced	Can	7 to 12	5 to 6
Parsley, dehydrated	Can	36 to 48	6 to 12

For footnotes see page 11.

Table IV. Subsistence Storage Data Nonperishables—Continued

Item	Unit	Safe storage life	
		70° F.	90° F.
Peaches	Can	24 to 36	12 to 15
Peaches, dried	Can	7 to 12	3 to 4
Peanuts, roasted, shelled	Can	18 to 24	10 to 12
Peanut butter	Can	18 to 24	10 to 12
Pears	Can	20 to 24	12 to 15
Pears, dried	Can	7 to 12	3 to 4
Peas	Can	30 to 36	18
Pepper, black, ground	Box*	36 to 48	6 to 12
Pickles, cucumber:			
Dill	Can; jar**	7 to 12	5 to 6
Sweet	Can; jar**	12 to 24	10 to 12
Pineapple	Can	20 to 24	12 to 15
Pineapple and rice	Can	24 to 36	18
Plums	Can	7 to 12	3 to 4
Pork sausage, links	Can	18 to 24	18
Pork steaks	Can	24 to 30	18
Potatoes:			
Sweet	Can	24 to 36	18
Sweet, dehydrated	Can	12 to 24	7 to 9
White	Can	24 to 48	7 to 9
White, dehydrated	Can	24 to 48	7 to 9
Pound cake	Can	48	24 to 36
Prunes, dried	Can	12 to 24	7 to 9
Pudding, steamed	Can	24 to 36	12 to 18
Raisins, seedless	Can	12 to 24	7 to 9
Rice, parboiled	Bag*	48	24 to 36
Sage, rubbed	Package*	24	6 to 9
Salad oil	Can	12	6 to 9
Salmon	Can	12 to 24	6 to 12
Salt, table	Carton*	Indefinite	Indefinite
Sauerkraut	Can	7 to 12	5 to 6
Shortening compound	Can	18 to 24	12 to 15
Sirup	Can	12 to 24	10 to 12
Soup:			
Chicken noodle, dehydrated	Can	12 to 24	7 to 9
Condensed, assorted	Can	12 to 18	6 to 8
Grean pea, dehydrated	Can	12 to 24	7 to 9
Soup and gravy base	Can	24	12 to 18
Spaghetti:			
With ground meat	Can	24 to 30	18
With meat balls	Can	24 to 30	18
Spinach	Can	24 to 36	12 to 15
Steak, beef	Can	36 to 48	24

For footnotes see page 11.

Table IV. Subsistence Storage Data Nonperishables—Continued

Item	Unit	Safe storage life	
		70° F.	90° F.
Sugar:			
Brown	Carton or bag*	Indefinite	Indefinite
Refined, granulated	Carton or bag* or	Indefinite	Indefinite
Powdered	Carton bag*	Indefinite	Indefinite
Tea	Can,	12 to 18	12
Tea, instant	Can Jar, or packet	36	16

Tomato paste	Can	7 to 12	5 to 6
Tuna	Can	12 to 24	6 to 12
Tuna and noodles	Can	12 to 24	6 to 12
Turkey, boned, solid pack	Can	36 to 48	30 to 36
Vinegar	Bottle**	18 to 24	12 to 18
Vinegar, dry	Jar*	36 to 48	24 to 36
Worcestershire sauce	Bottle*	36 to 48	6 to 12
Yeast, bakers active, dry	Can	7 to 12	3 to 6

* Items must be stored in covered storage.
** Items must be stored in covered storage under freezing conditions.

11. Perishable Subsistence Storage Data

Table V may be used as a guide for determining the proper storage temperatures for items of perishable subsistence and the approximate safe storage life of items at the temperatures given.

Table V. Safe Storage Periods—Perishable Subsistence

Item	Best storage temperature (degrees F.)	Approximate storage life
Apples	32	2 to 3 months
Apricots	32	7 to 10 days
Artichokes:		
Jerusalem	32	2 to 5 months
Glove	32	7 to 14 days
Asparagus	32	3 to 4 weeks
Avocados	40–55	4 weeks
Bananas	60–68	7 to 10 days

Table V. Safe Storage Periods—Perishable Subsistence—Continued

Item	Best storage temperature (degrees F.)	Approximate storage life
Beans:		
Green or snap	32	2 to 4 weeks
Lima	32	2 to 4 weeks
Beets:		
Bunch	32, 33	10 to 14 days
Topped	32, 33	1 to 3 months
Blackberries	32	7 to 10 days
Broccoli	32, 33	7 to 10 days
Brussels sprouts	32, 33	3 to 4 weeks
Butter (frozen)	−10–0	1 year
Butter (fresh)	35	2 months
Cabbage	32, 33	3 to 4 months
Carrots:		
Bunch	32, 33	7 to 10 days
Topped	32, 33	4 to 5 months
Cauliflower	32, 33	2 to 3 weeks
Celery	32, 33	2 to 4 months
Cheese	32	3 to 4 months
Cherries	32	10 to 14 days
Corn, sweet	32	3 to 5 days
Cranberries	36–40	1 to 3 months
Cucumbers	40–50	10 to 14 days
Currants	32, 33	10 to 14 days
Dates	30–32	7 to 10 days
Dewberries	32	7 to 10 days
Eggplant	40–50	7 to 10 days
Eggs:		
Shell	29–31	9 months
Shell, farm cooler	40–55	1 to 2 weeks
Frozen	−10–0	3 to 4 months
Dried, whole	35	6 months
Dried, yolk	35	6 months
Dried, spray albumen	35	6 months
Endive (escarole)	32	2 to 3 weeks
Figs, fresh	65–75	5 to 7 days
Fish:		
Fresh	33–40	1 to 3 days
Frozen	−10–0	3 to 4 months
Frozen juice concentrates:		
Grape	0	1 year
Grapefruit	0	1 year
Lemon	0	1 year
Orange	0	1 year
Frozen-pack fruits	−10–0	6 to 12 months
Frozen-pack vegetables	−10–0	6 to 12 months

Table V. Safe Storage Periods—Perishable Subsistence—Continued

Item	Best storage temperature (degrees F.)	Approximate storage life
Garlic, dry	32	6 to 8 months
Gooseberries	31, 32	3 to 4 weeks
Grapefruit	32–34	6 to 8 weeks
Grapes:		
American-type	31, 32	3 to 8 weeks
European-type	30, 31	3 to 6 months
Ice cream	0	7 to 10 days
Lard (wighout antioxidant)	32, 33	4 to 8 months
Leeks	32	1 to 3 months
Lemons	50	1 to 3 months
Lettuce	32, 33	2 to 3 weeks
Limes	45–48	6 to 8 weeks
Loganberries	31, 32	7 to 10 days
Margarine	35	1 year
Meats:		
Bacon, smoked	32	7 to 12 days
Bacon, frozen	0	6 to 8 months
Beef:		
Dried	0	3 to 6 months
Fresh	32	1 to 6 weeks
Frozen	−10–0	9 to 12 months
Corned	0	3 to 6 months
Hams and shoulders:		
Fresh	32	7 to 12 days
Frozen	−10–0	6 to 8 months
Canned	0	1 year
Cured	32	1 to 2 months
Lamb:		
Fresh	32	5 to 12 days
Frozen	−10–0	8 to 10 months
Liver	0	6 to 9 months
Pork:		
Fresh	32	3 to 7 days
Frozen	−10–0	4 to 8 months
Sausages:		
Smoked	32	7 to 12 days
Fresh	32	3 to 5 days
Frozen	−10–0	2 to 3 months
Veal:		
Fresh	32–34	5 to 10 days
Frozen	−10–0	3 to 4 months
Melons:		
Casaba and Persian	36–40	4 to 6 weeks
Honeydew and honeyballs	36–38	2 to 4 weeks
Muskmelons	32–34	7 to 10 days
Watermelons	36–40	2 to 3 weeks

Table V. Safe Storage Periods—Perishable Subsistence—Continued

Item	Best storage temperature (degrees F.)	Approximate storage life
Milk	32–35	3 days
Onions	32	6 to 8 months
Oranges	32–34	8 to 10 weeks
Parsnips	32	2 to 4 months
Peaches	32	2 to 4 weeks
Pears	32	2 to 3 months
Peas, green	32	1 to 2 weeks
Peppers, sweet	32	4 to 6 weeks
Persimmons	32	2 to 3 weeks
Pineapples:		
Mature green	50–60	3 to 4 weeks
Ripe	40–45	2 to 4 weeks
Plums	32	3 to 8 weeks
Potatoes, white Irish	38–40	8 to 10 weeks
Poultry:		
Fresh	32	1 week
Frozen	−10–0	8 to 10 months
Prunes	32	3 to 8 weeks
Pumpkins	50–55	2 to 6 months
Quinces	32	2 to 3 months
Radishes	32	2 to 4 months
Rabbit:		
Fresh	32	1 to 5 days
Frozen	−10–0	0 to 6 months
Raspberries	32	7 to 10 days
Rhubarb	32	2 to 3 weeks
Rutabagas	32	2 to 4 months
Salsify	32	2 to 4 months
Spinach	32	10 to 14 days
Squashes	50–55	2 to 6 months
Strawberries	32	7 to 10 days
Sweet potatoes	50–60	4 to 6 months
Tomatoes:		
Mature green	50–70	3 to 5 weeks
Ripe	40–50	7 to 10 days
Turnips	32	4 to 5 months
Yeast:		
Compressed	34–38	15 to 21 days
Dry granulated	40–50	2 to 3 months

12. Canned Food Data

Data on cans most commonly used in the canning of fruits and vegetables are shown in table VI. The "can equivalents" columns of table VI indicate the number of cans needed to equal each of the cans designated in the "type of can" column. Table VII gives the case equivalents of the more commonly used cans. The No. 2 and the No. 2½ case equivalents may be obtained by dividing the number of cans per case (col 5, table VI) of the can to be converted by 24 and multiplying the result by the can equivalent.

Table VI. Dimensions, Capacities, and Conversion Factors of Cans

Type of can	Dimensions*	Water capacity at 68° F. (oz)	Can equivalents			Cans per case
			No. 2	No. 2½	No. 10	
6Z	202 x 308	6.08	0.295	0.203	0.056	48
8Z short	211 x 300	7.93	.386	.266	.072	48, 72

No. 1 tall	301 x 411	16.70	.813	.561	.153	48
No. 303	303 x 406	16.88	.821	.566	.154	24 or 36
No. 303 cylinder	303 x 509	21.86	1.060	.731	.200	24
12Z vacuum			.72	.50	.142	24
No. 2 vacuum	307 x 306	14.71	.716	.50	.134	24
No. 2	307 x 409	20.55	1.000	.689	.188	24
No. 2 cylinder	307 x 512	26.4	1.284	.886	.241	24
No. 2½	401 x 411	29.79	1.450	1.000	.272	24
No. 3			.171	1.18	.347	24
No. 3 vacuum	404 x 307	23.9	1.162	.80	.218	24
No. 3 cylinder	404 x 700	51.7	2.515	1.735	.472	12
No. 5	502 x 510	59.1	2.8744	1.983	.540	12
No. 10	603 x 700	109.43	5.325	3.673	1.000	6

* The first group of digits in this column represents the outside diameter of the can; the second group, the height of the sealed can. The first digit of each group represents inches; the second and third digits of each group represent sixteenths of an inch. For example, the 6Z can is 2 5/16 inches in diameter and 3 3/16 inches in height.

Table VII. Case Equivalents

Type of can	Case equivalents		
	No. 2	No. 2½	No. 10
6Z (48)†	0.59	0.40	0.43
8Z tall (48)†	.84	.58	.63
8Z tall (72)†	1.27	.87	.95
8Z short (48)†	.77	.53	.58
8Z short (72)†	1.16	.80	.86

For footnote see page 16.

† Number of cans per case.

13. Determining Cubic Feet in Ton of Hay

The average number of cubic feet per ton of hay depends upon the period of time the hay has been stacked. Table VIII may be used as a guide.

Table VIII. Cubic Feet in Ton of Hay

Time in stack	Cubic feet per ton
30 days or less	589.6
30 to 60 days	581.5
60 to 155 days	541.9

14. Perishable Subsistence Components—Weights and Cubes

Table IX provides information on weights and cubes of perishable subsistence components. It may be used as a guide for planning the build-up of perishable subsistence components. The table supplies information on the supplementation of the Standard B Ration with perishable items in oversea areas, both in the communications zone and combat zone.

a. Phases. The numbers 1 through 13 in the table represent 13 different perishable ration phases. It is anticipated that upon mobilization, situations will exist locally wherein cold storage facilities are already available or will soon be built. The phase which can be selected is

Table IX. Weights and Cubes of Perishable Component Buildup for Planning Purposes (PER 1,000 RATIONS)

Estimated progressive buildup of perishable ration components, following an operation where no perishables are utilized.

This table is a guide for use in computing perishable ration component requirements and storage data for war plans and operational projects.

* Based on 30½ day month.

Note "A". Packaged weights and cubes for phases 1 through 12 are based on Part II, SM 10–1–8900.

Note "B". Weights and cubes for phase 13 (Full A Ration) are based on the average requirement of three packaged cubic feet per month. Breakdown between Freeze, Chill, and Vent will vary according to specific "A" Menu).

dependent upon the troop strength and storage facilities. For example, some areas will have facilities capable of supporting phase 13; others may have facilities sufficient only of supporting phase 3; others may be able to support phase 9. It is expected that supplementation of the Standard B Ration will begin as phase 1. The selection of items is based on experience gained during World War II, and indicates the most desirable items at the most desirable frequency of issue.

b. Storage Requirements. When prefabricated refrigeration is to be considered, cube and square footage must be known; whereas, when fixed refrigeration warehouses are to be used, calculations should include square footage unless the ceiling height is known. If the ceiling height is known, both should be included. As a rule of thumb, 65 percent of the available net cubage is usable if stocking is to be by hand (5 ft–6 ft); 75 percent if stocking is to be by forklift truck (10 ft) (SR 30–20–10).

c. Interpretation of Issue Amounts. All information for subsistence is expressed in the table as pounds per 1,000 rations. This figure is selected for utility. For example, 1,000 rations can be used as the requirement for 1,000 men for 1 day and from that easily projected to 10,000, 100,000, or 1,000,000. Likewise, for menu planning, it means food for 100 men for 10 days. For menu planning purposes, multiplying by 3 will provide the requirement for 1 month for 100 men (100 x 10 x 3). For phase 1, the allowance of boneless beef is 81.67 pounds for 1,000 rations or 81.67 pounds for 100 men for 10 days, which when multiplied by 3 gives 245 pounds for 100 men for a 30-day period. To the subsistence officer, the net weight given as pounds per 1,000 rations for each item provides the basis for subsistence planning.

CHAPTER 3

QUARTERMASTER GENERAL SUPPLIES AND EQUIPMENT

15. Initial Issue, Replacement, and Consumption

a. Initial Issue. The initial issue of equipment is the supply of an item approved for issue to troops or other using agencies that have not previously been supplied such equipment. Initial issue consists of issues to inductees, issues to newly activated units, issues of new standard items, issues arising from increases in allowances due to changes in tables of organization and equipment and tables of allowances, items approved for issue in excess of the quantity authorized in approved tables, and items approved for issue to units for which there are no approved tables.

b. Replacement Issue. The replacement issue of equipment is that portion of the issues made to using agencies which replaces equipment previously supplied in order that the standards of efficiency prescribed by the Department of the Army may be maintained. Such issue consists of replacement of unserviceable equipment and replacement of losses due to wearing out beyond economical repair, abandonment, destruction, enemy action and pilferage.

c. Expendable Item. An expendable item is an item which is normally expended or used up beyond recovery in the use for which it was designed or intended.

d. Replacement Factors.

(1) The replacement factors for clothing and individual equipment represent the quantity of an item required for issue to each using individual each month regardless of the allowance in effect for the item. To obtain a quantitative replacement requirement for an item for 1 month, the factor for an individual item is multiplied by the number of individuals for whom the item is authorized during that month. This quantitative replacement requirement is valid whether each using individual is allowed one or more than one unit of the item.

(2) The replacement factors for all other items represent the quantity of the item required each month to replace each unit of the item authorized to be in use. To obtain a quantitative replacement requirement for an item for 1 month, the factor

is multiplied by the total number of units of the item authorized to be in use during that month.

e. Consumption Rate. A consumption rate represents the average quantity of an item expended during a given time interval by a specified number of users. Typical bases of consumption rates are pounds per using individual per day or quantity per 1,000 men per month. To obtain a quantitative consumption requirement for a quartermaster item for 1 month, the consumption rate is multiplied by the average number of using individuals (in thousands) during the month.

f. Sources of Replacement Factors and Consumption Rates. SB 10–38 provides a tabulation of peacetime replacement factors and consumption rates for standard quartermaster items of supply. SB 10–496 provides a tabulation of wartime replacement factors and consumption rates for standard quartermaster items of supply. Replacement factors and consumption rates given in SB 10–38 are used for the following purposes:

(1) The computation of replacement quantities needed for the establishment, within the supply control system, of the overall requirements of the Department of the Army.

(2) The computation of stockage objectives and requisitioning objectives for the continental United States and oversea commands.

(3) The editing of requisitions for materiel intended for replacement and consumption and all other authorized documents relating to replacement and consumption supply, as applicable.

(4) A guide in the determination of requirements for replacement and consumption quantities of items authorized for local procurement.

16. Tentage

Data on standard tents are given in tables X and XI.

Table X. Data on Standard Tents

Type of tent	Size			No. of men accommodated	Weight (lbs)		Bulk in storage (cu ft)		Remarks
	Floor dimensions	Height of ridge	Height of side wall		Tent only	Pins and poles	Tent only	Pins and poles	
Tent, arctic, 10-man, FWWMR, OD.	6-sided each side 8′6″	8′6″	3′	10	68	8	7.10	0.20	A 6-sided pyramidal tent supported by a telescopic center pole, this tent provides shelter for 10 men operating in extremely cold and cold-wet areas. The tent has a stovepipe opening and a fire-resistant liner for insulation purposes.
Tent, assembly, M–1942, FWWMR, OD.	40′ x 80′	21′	8′	80 (quarters). 500 (seated)	1,100	655	23.3	16.9	This is a large circus-type tent, with a rectangular center section and hip-roofed ends. The top is made in four sections that lace together. The side walls also have four sections which may be rolled up or removed when weather conditions permit. This tent is authorized for chaplains in the field or for other purposes, such as lectures or the showing of motion pictures. The tent also may be

									used for storage, truck maintenance, quartering personnel, housing the M–1945 mobile bakery unit, and other authorized uses.
Tent, command post, M–1945, FWWMR, OD.	10′ x 13′9″	9′	5′6″	3	165	92	6.3	3.6	The central part of this tent is A-shaped. The ends are hip-roofed, with converging side walls. A liner is provided for insulation, and wall screens for insect protection. The tent can be completely blacked out. It is used in theaters of operation to provide office shelter for staff sections of the several command echelons. When necessary, it may be used for quartering of three persons. It also may be used as a battalion aid station since the blackout vestibule is long enough to accommodate a litter and bearers.

Table X. Data on Standard Tents—Continued

Type of tent	Size			No. of men accommodated	Weight (lbs)		Bulk in storage (cu ft)		Remarks
	Floor dimensions	Height of ridge	Height of side wall		Tent only	Pins and poles	Tent only	Pins and poles	
Tent, frame-type, insulated, sectional, with floor, M-48.	Basic size, 16′ x 16′; extendible in length by 4′ intermediate	8′	Semi circular in cross section	4–6	556 (canvas components)	1,696 (wood & metal components)	Total 250*		This is a general-purpose vehicle-portable frame-type tent designed for use in cold climates. It is constructed of insulated blankets supported on laminated wooden arches. The floor units are insulated boxes which, when locked together in pairs, also serve as packing cases for other components of the tent.
Tent, general-purpose, large, FWWMR, OD.	18′ x 52′	12′	5′6″	24	Tent: 420 Liner 155	245	60.2	8.8	The tent is hip-roofed, square ended and rectangular in shape. It is used when a large tent is needed for storage or shelter. It may be used as a small bakery or hospital ward. The tent has 2 entrances, one at each end. Two curtains, attached to each end and near the door entrances, slide

along a double wire cable at the eave to open or shut the door. Four screened vinyl plastic windows equipped with blackout flaps are located on each side of the tent below the eave. The tent deck has ventilators at each end. Further ventilation can be obtained by leaving the door curtains open. The canvas is suspended on a webbing framework, which carries the stress and supports the canvas. The tent is pitched with the center pole placed 2 feet off center to create an unobstructed aisle extending the length of the tent. The tent is equipped with a liner with both fabric and screening side walls. The liner provides additional insulation in cold climates, and ventilation and insect protection when the tent and fabric liner side walls are rolled up in hot climates.

*Includes tents and pins. This tent has no poles.

Table X. Data on Standard Tents—Continued

Type of tent	Size			No. of men accommodated	Weight (lbs)		Bulk in storage (cu ft)		Remarks
	Floor dimensions	Height of ridge	Height of side wall		Tent only	Pins and poles	Tent only	Pins and poles	
Tent, general-purpose, medium, FWWMR, OD.	16′ x 33′	10′	5′6″	12	Tent: 255 Liner 90	200	Tent: 12.7 Liner 8.0	6.3	A hip-roofed tent similar in size to the limited standard tent, squad, M–1945, which it replaces. The tent is designed to satisfy general-purpose requirements, such as storage, personnel housing, fire direction centers, and mess tents. Each end is provided with a 4-foot-wide door, formed by two curtains which are opened and closed by sliding along a double wire at the eaveline. Screened vinyl plastic windows equipped with blackout flaps are located on each side. The tent deck has ventilators at each end and insulated stovepipe openings near the ridge. The guyline stress is carried by a webbing frame sewed in the

									tent. The tent is equipped with a liner with both fabric and screening side walls; the liner provides additional insulation in cold climates and ventilation and insect protection when tent and fabric liner side walls are rolled up in hot climates.
Tent, hexagonal, lightweight M–1950, FWWMR, OD.	6-sided each side 6′7½″ long	Peak 8′6″	2′	5–7	40	8.0	3.6	.2	A 6-sided pyramidal tent supported by a telescopic pole, this tent provides shelter for troops operating in extremely cold and cold-wet areas. The tent has a stovepipe opening and a fire-resistant liner for insulation purposes. It may be manpacked.
Tent, sectional, hospital, FWWMR, OD.	18′ x 53′	12′	6′	24	770	217	31.5	12.2	A rectangular, hip-roofed, square-end tent, made in sections that may be put together in various combinations. The tent normally consists of two end and three middle sections, with a vestibule at each end, and is equipped with a liner for insulation, detachable screening side walls for protection against insects, and a sod

Table X. Data on Standard Tents—Continued

Type of tent	Size			No. of men accommodated	Weight (lbs)		Bulk in storage (cu ft)		Remarks
	Floor dimensions	Height of ridge	Height of side wall		Tent only	Pins and poles	Tent only	Pins and poles	
Tent, sectional, hospital, FWWMR, OD.—Continued									cloth. High side walls allow maximum use of interior floor space and inside aisles for litter passage, while sectional construction permits extension to any desired length. Used with field hospital units, as a hospital ward or as a surgical operating room.
Tent, kitchen, flyproof, M–1948, FWWMR, OD.	18′ x 12′	9′ stack 12′	6′ stack 9′	----------	202	217	14.2	11.8	This tent is used as a shelter during the cooking and serving of food in the tropics. It is a rectangular A-type, square-end tent. The back portion of the tent forms a stack higher than the rest of the tent. The side and front walls may be guyed out, forming awnings on the sides and front. A wall screen which snaps to the tent provides an insectproof closure on sides and front

								when the walls are raised. The tent may be completely blacked out.
Tent, maintenance shelter, FWWMR, OD.	18′2″ x 26′9½″	13′7¾″	5′6″		500	Frame 755	26.3	58	This tent is used by the Ordnance Corps in theaters of operations for the repair of tanks and trucks. It looks like a wall tent but can be erected over a steel frame, which eliminates the use of interior poles and permits entrance of vehicles. A section of the roof may be lowered by means of slide fasteners operated by ropes to give a 10- by 10-foot opening, through which heavy equipment may be moved by a crane outside the tent. Six ground cloths are provided with each tent to form a floor for men working under vehicles.
Tent, mountain, 2-man, FWWMR, OD and white.	54″ x 82″	43″	Triangular in cross section	2	6	3.6	0.5	0.2	A man-packed, lightweight housing for two men, designed to be used in cold-climate operations, particularly in mountainous areas when ordinary means of transportation are not available for bringing in heavier types of tentage.

Table X. Data on Standard Tents—Continued

Type of tent	Size			No. of men accommodated	Weight (lbs)		Bulk in storage (cu ft)		Remarks
	Floor dimensions	Height of ridge	Height of side wall		Tent only	Pins and poles	Tent only	Pins and poles	
Shelter, half, tent, WWMR.	64″ x 84″ (approximately, for two shelter halves joined).	43″	Triangular in cross section.	2	3	1	.3	.1	This shelter half is one-half a small tent. Two shelter halves joined together form a tent providing shelter for two men. The shelter half is carried by each man as part of the field pack.
Tent, wall, large, FWWMR, OD.	14′6″ x 14′	11′	4′6″	6–8	130	145	5.8	3.1	Used as a hospital ward for pack medical units. Also used as an officers' mess, for storage of supplies, or for quartering personnel.
Fly, tent, wall, large, FWWMR, OD.	21′6″ x 14′5″	----------	----------	----------	50	----------	1.6	------	The fly is suspended above the deck of the tent to lower the temperature within the tent. It may be pitched independently of the tent to provide quick shade and shelter. It can be used for field kitchens.
Tent, wall, small, FWWMR, OD.	8′10″ x 9′2″	8′6″	3′9″	2	55	60	3.4	4.1	This tent is used mainly for the shelter of officers when in the field and not in combat. It may also be used as a

Fly, tent, wall, small, FWWMR, OD.	15′6″ x 9′4″	----------	----------	----------	23	----------	0.7	------	field first-aid station, command post, or a small storage tent. The fly is suspended above the deck of the tent to lower the temperature within the tent. It may be pitched independently of the tent to provide quick shade and shelter. It can be used for field kitchens.

Table XI. Allowances of Heating Equipment Per Tent

Type of tent	Heating equipment		
	Stove, tent, M–1941	Heater, tent, gasoline	Stove, yukon
Tent, arctic, 10-man, FWWMR, OG			1
Tent, assembly, M–1942, FWWMR, OD	4		
Tent, command post, M–1945, FWWMR, OD	1		
Tent, frame-type, insulated, sectional, with floor, M–1948.	1 or 2		
Tent, general-purpose, large, FWWMR, OD	3		
Tent, general-purpose, medium, FWWMR, OD	2		
Tent, hexagonal, lightweight, M–1950, FWWMR, OD			1
Tent, sectional, hospital, FWWMR, OD	*3		
Tent, kitchen, flyproof, M–1948, FWWMR, OD			
Tent, maintenance shelter, FWWMR, OD		1	
Tent, mountain, 2-man, FWWMR, OD and white			
Shelter half, tent, WWMR			
Tent, wall, large, FWWMR, OD	1		
Tent, wall, small, FWWMR, OD	1		

* The sectional hospital tent is usually erected with three center sections. One tent stove for each additional center section used should be added.

17. Refrigeration Supplies

a. Requirements.

(1) Each man will require approximately 3.32 cubic feet of refrigerated storage space per month of supply.

(2) Where ice is required, ice requirements are approximately 2 pounds per man per day.

b. Refrigeration Equipment. Table XII gives information on refrigeration equipment.

Table XII. Data on Refrigeration Equipment

Item	Name	Manufacturer, model No.	Federal stock No.	Storage capacity (cu ft)	Weight (lb)		Dimensions uncrated (in.)	Kind of power	Remarks
					Net	Shipped			
1	Refrigerator, mechanical, commercial, portable chest type.	York	4110–025–9039	25	2,600	3,600	94⅛ x 39¼ x 61$\frac{1}{16}$	Gasoline	This refrigerator is equipped with holdover plates set for 10° F. in 1944 models and for 0° to 40° F. in later models. It is designed for the shipment and limited storage of frozen beef and for occasional use as mess refrigerator by isolated units of less than company strength. Two refrigerators may be mounted on a 2½-ton truck or one on a 1-ton trailer. This refrigerator operates in transit.
		Universal	4110–289–2022	25	2,460	-------	94 x 38 x 57	Gasoline	
2	Refrigerator, mechanical, commercial, complete unit, reach-in type.	(Various)	4110–194–1572	65	950	2,285	90 x 36 x 78	Electric	This refrigerator is designed for use as organizational mess equipment and operates on 115-volt, 60-cycle, single-phase alternating current. It is designed for general storage and is not suitable for storage of frozen foods.

Table XII. Data on Refrigeration Equipment—Continued

Item	Name	Manufacturer, model No.	Federal stock No.	Storage capacity (cu ft)	Weight (lb)		Dimensions uncrated (in.)	Kind of power	Remarks
					Net	Shipped			
3	Refrigerator, mechanical, commercial, portable walk-in type.	Brown SPE–12	4110–222–2195	150	1,940	-------	101 x 76⅝ x 71¼	Gasoline	This is a heavy, rugged refrigerator designed for severe outdoor use with low maintenance. It contains a fully automatic blower-type refrigerating system with a temperature range from 10° to 40° F. It may be used as a temporary organizational storage warehouse or for shipment of foods by truck or ship. It can be mounted on a 2½-ton truck and will operate in transit.
4	Refrigerator, mechanical, commercial, complete unit, prefabricated, sectional, walk-in type.	----------	4110–194–1578	320	3,670	-------	96 x 96 x 94	Electric	This refrigerator is a general-storage refrigerator designed to maintain a 35° F. temperature while operating under conditions where the ambient temperature is 100° F. The refrigerator contains an air-cooled condensing unit operated by a 1-horsepower motor. This refrigerator is intended for erection within existing structures and is not to be

									used as a separate building. It is provided with one walk-in door and is not compartmented.
5	Refrigerator, mechanical, commercial, complete unit, prefabricated, sectional, walk-in type.	----------	4110–194–1579	405	5,533	--------	96 x 120 x 94	Electric	Same as item 4 except for size and storage capacity.
6	Refrigerator, mechanical, commercial, complete unit, prefabricated, sectional, walk-in type.	----------	4110–194–1583	1,310	13,119	--------	288 x 120 x 94	Electric	Same as item 4 except for size, storage capacity, and has three doors.
7	Refrigerator, mechanical, commercial, complete unit, prefabricated, walk-in type.	----------	4110–194–1584	1,650	13,575	--------	360 x 120 x 94	Electric	Same as item 6 except for size and storage capacity and for the fact that the refrigerator is equipped with a 1-horsepower condensing unit and a 2-horsepower condensing unit. The two condensing units operate independently of each other; the 1-horsepower unit provides refrigerant for one section of the refrigerator and the 2-horsepower unit for the other two sections.
8	Refrigerator, prefabricated, with refrigerating equipment.	----------	4110–203–4658	845	--------	--------	192 x 120 x 94	Electric	This refrigerator is a general storage refrigerator designed to maintain a 35° F. temperature while operating under conditions up to 100° F. This refrigerator is intended for

					Net	Shipped			
8	Refrigerator, prefabricated, with refrigerating equipment—Continued.								erection within existing structures and is not to be used as a separate building. It is provided with two walk-in doors.
9	Refrigerator, mechanical, commercial, complete unit, prefabricated, sectional, walk-in type.	----------	4110–197–5901	2,000	--------	--------	348 x 126 x 114	Electric	This refrigerator is designed for erection within existing structures or to be otherwise sheltered and protected. It is equipped with evaporator plates capable of maintaining a 0° F. temperature while operating in an ambient temperature of 110° F. with a wet bulb condition of 80° F. A 3-horsepower condensing unit is used to furnish power to the refrigerator system and it operates from a 220-volt, 60-cycle, 3-phase electric motor.
10	Refrigerator, mechanical, commercial, complete unit, prefabricated, sectional, walk-in type.	----------	4110–197–5902	4,000	16,000	29,182	696 x 126 x 114	Electric	Same as item 9 except for size and storage capacity and for the fact that the refrigerator is powered by a 7½ horsepower motor.

11	Refrigerator, prefabricated, without refrigerating equipment.	SPE–17 No. 1	4110–240–1178	600	3,218	6,300	111 x 94 x 153	----------	This warehouse is designed for use with an externally mounted refrigerating unit which is capable of maintaining a temperature of 0° to 35° F. during normal operation. It may be erected inside an existing structure or used as a separate building.
12	Refrigerator, prefabricated, without refrigerating equipment.	----------	4110–240–1176	1,800	10,060	--------	297 x 94 x 153	----------	Same as item 11 except that this warehouse is divided into two rooms and requires two condensing units for normal operation.
13	Ice cream plant, portable, 2½–40 gallons.	Tecknicraft X101–Q–10–QM	4110–254–4734	40 gallons	1,590	2,490	104 x 35 x 51	Electric	This ice cream plant has a freezer capacity of 2½ gallons and a hardening cabinet capacity of 40 gallons. It has an attached electric generator and an electrical connection for operation from an outside power source.
14	Ice cream plant, portable, 2½–40 gallons, with electric motor and gasoline engine.	Mills	4110–170–8233	40 gallons	1,300	1,880	79 x 36 x 56	Gasoline and electric	This ice cream plant has a self-contained gasoline engine and an electric motor. It has a freezer capacity of 2½ gallons and a hardening cabinet capacity of 40 gallons.

18. Special-Purpose Vehicles and Equipment

Data on special-purpose vehicles and equipment are given in table XIII.

Table XIII. Data on Special-Purpose Vehicles and Equipment

Name	Weight (lbs)	Dimensions (in.)			Cubage (cu ft)	Remarks
		Length	Width	Height		
a. Bath.						
(1) Bath unit, field, mobile, 24-showerhead, Model 2B–24.	3,800	105	72	57	249	This unit is an insulated and jacketed, oil-fired, welded steel fire tube boiler, with a hinged water back for preheating the water. It is designed to deliver approximately 1.8 to 2 gallons of warm bathing water per minute to each of the 24 showerheads. The unit is mounted on a 2-wheel trailer.
(2) Bath unit, field, mobile, 24-showerhead, Cleaver-Brooks Model EC–8D.	4,115	150	70	57.5	350	This bath unit is a self-contained liquid-fuel-fired water heater designed to supply approximately 1.6 gallons of warm bathing water per minute to each of the 24 showerheads. It is mounted on a 2-wheel trailer.
(3) Bath unit, field, mobile, 24-showerhead, M–1950.	5,600	151	72	67	421.6	This unit is an oil-fired boiler with a water back and heat exchangers. It is designed to deliver approximately 2 gallons of warm bathing water per minute to each of the 24 showerheads. It is mounted on a 2-wheel trailer.

b. Laundry.						
(1) Laundry, mobile, 2-trailer type:						This mobile laundry unit consists of a washer trailer with water heater, washer and extractor; and a tumbler trailer with a tumbler-dryer, engine and generator. These two trailers, used together, furnish complete laundering facilities with a capacity of 120 pounds dry weight per hour.
Trailer No. 1	4,300	168	78	84	637	
Trailer No. 2	4,200	168	78	84	637	
(2) Laundry, portable, skid-mounted, small detachment.	418	27.5	26	32	13	This unit consists of two laundry skids and a separately mounted, gasoline-engine-driven generator on a metal base. The washer skid includes the water heater, washer, and extractor. The tumbler skid includes the tumbler-dryer, and air heater. The capacity of the unit is approximately 50 pounds dry weight per hour.
c. Reclamation and maintenance:						
(1) Trailer, clothing repair, 2-wheel	4,400	108	67	66	277	The equipment consists of an electric generator, 6 sewing machines, 1 darning machine, and 1 button machine, plus all the accessories and auxiliary equipment for a complete clothing repair operation. It is carried on a 2-wheel trailer with a payload capacity of 2,950 pounds.

						When in position, it rests on wheels and leveling jacks, and in travel is towed by any vehicle equipped with standard Army-type pintle.
(2) Trailer, textile repair, 2-wheel	4,400	108	67	66	277	The equipment consists of 2 light sewing machines, 2 medium sewing machines, 1 darning machine, 1 overedge machine, and all the accessories and auxiliary equipment necessary for the field repair of canvas items. It is carried on a 2-wheel trailer with the same general characteristics as that used for the clothing repair units.
(3) Trailer, shoe-repair, 2-wheel	4,700	108	67	66	277	The equipment consists of a stitching and finishing machine, sole cutter, skiving machine, patching machine, 6 jacks, 1 electric generator, and all the accessories and auxiliary equipment necessary for a complete shoe repair operation. The unit is carried on a 2-wheel trailer with the same general characteristics as that used for the clothing repair unit.
d. Bakery.						
(1) Field bakery, portable, M–1942:						A section of the M–1942 portable field baking equipment consists of two M–1942 field bake ovens; four pot-type burners; a dough-mixing machine, gasoline-motor-driven; nine folding bread racks; 48 pans, baking and roasting; fermentation cans; tents; tables; and all necessary small accessories.
Oven	1,100	63	34	78	97	
Dough-mixing machine	525	20	39	46	21	
Gasoline engine	49	16.5	13⅝	16.5	2	
Water heater	45	30

		Length	Width	Height		
(2) Bakery unit, mobile, M–1945:						This unit consists of one mixing and makeup machinery trailer, two oven trailers, two 36-pan proofing cabinets, five dough troughs, two generator trailers, one flour sifter, folding bread racks, wheel conveyors, tents, and tables. Motive power is provided by trucks.
Mixing and makeup machine trailer.	11,000	197	88	111	1,114

CHAPTER 4

PETROLEUM

19. Petroleum Products Commonly Used in Theater of Operations

A tabulation of standardized fuels and lubricants that have been approved for procurement and use in Army equipment may be found in SB 38–5–3. In accordance with the policy of gasoline conversion, AR 754–9130–1 prescribes the limitations on the use of automotive-type gasoline. Table XIV provides data on commonly used petroleum products.

Table XIV. Petroleum Products Data[1]

Product	Specific gravity	API[2] gravity	Pounds per U.S. gallon
Aviation gasoline (100/130)	.7121	67.2	5.928
Aviation gasoline (115/145)	.7012	70.3	5.837
Automotive combat gasoline	.7332	61.5	6.103
Jet fuel (JP–4)	.7949	46.5	6.618
Kerosene	.8155	42.0	6.790
Diesel fuel (40 cetane)	.8448	36.0	7.034
Lubricating oil, engine	.8927	27.0	7.434
Navy special fuel oil	.9465	18.0	7.882
Avlube	.8888	27.7	7.401

[1] Averages.

20. Petroleum Conversion Factors

Table XV may be used for the conversion of weights and measures in handling petroleum products.

Table XV. Petroleum Conversion Factors

Multiply—	By—	To obtain—
Barrels	5.61	Cubic feet
Barrels	42.0	Gallons
Barrels	6.29	Kiloliters
Cubic feet	7.48	Gallons

Table XV. Petroleum Conversion Factors—Continued

Multiply—	By—	To obtain—
Cubic feet	0.1782	Barrel
Cubic feet	0.025	Ton, measurement
Cubic feet	0.01	Ton, register
Cubic inches	0.0043	Gallon
Gallons	231.0	Cubic inches
Gallons	0.1337	Cubic foot
Gallons	3.7854	Liters
Gallons	0.0238	Barrel
Gallons (gasoline)	6.103	Pounds
Gallons (gasoline)	0.0031	Ton, short
Gallons (gasoline)	0.0033	Ton, measurement
Gallons (gasoline)	0.0027	Ton, long
Gallons (gasoline)	0.0026	Ton, metric
Gallons (oil)	7.434	Pounds
Kiloliters	0.159	Barrel
Liters	0.2642	Gallon
Pounds	0.1639	Gallon (gasoline)
Pounds	0.1345	Gallon (oil)
Tons, long	367.21	Gallons (gasoline)
Tons, measurement	303.03	Gallons (gasoline)
Tons, measurement	1.0	Ton, short (grease)
Tons, measurement	0.1086	Ton, short (gasoline)
Tons, measurement	1.4285	Tons, short (gasoline in drums)
Tons, measurement	1.2048	Tons, short (oil in drums)
Tons, measurement	40.0	Cubic feet (gasoline)
Tons, metric	373.10	Gallons (gasoline)
Tons, short	327.8	Gallons (gasoline)
Tons, short (gasoline)	0.9195	Ton, measurement
Tons, short (gasoline in drums)	0.7	Ton, measurement
Tons, short (grease)	1.0	Ton, measurement
Tons, short (oil in drums)	0.83	Ton, measurement

21. Expansion and Contraction of Petroleum Products

Because volumes of petroleum products increase or decrease in direct proportion to temperature increase or decrease, accurate temperature of a product must be taken at the time of gaging and the measured quantity corrected to the standard temperature of 60° F. When gaging large quantities, it is often necessary to take several temperature readings at various levels and average these readings to determine the true average temperature of the product. Table XVI specifies the number of readings necessary and the points at which readings should be taken for various depths of product.

Table XVI. Procedural Data for Petroleum Product Temperature Measurements

Depth of product	Minimum No. of temperature measurements	Measurement levels
More than 15 feet	3	3 feet below top surface of product, middle of product, and 3 feet above bottom surface of product.
10 feet to 15 feet	2	3 feet below top surface of product, and 3 feet above bottom surface of product.
Less than 10 feet	1	Middle of product.

22. Volume Correction for Petroleum Products

a. To convert a measured volume of product at observed temperature to corresponding volume at 60° F., it is first necessary to determine the API gravity group number corresponding to the product (table XVII).

b. Table XVIII gives conversion factors for the various API groups at observed temperatures. Multiply the volume at observed temperature by the appropriate conversion factor to obtain corresponding volume at 60° F. For example, 100 gallons of automotive combat gasoline (group 3) at an observed temperature of 80° F., is converted to corresponding volume at 60° F. by multiplying by the factor 0.9879. The result is 98.79 gallons at 60° F.

Table XVII. API Gravity Groups

Group No.	Coefficient of expansion	Corresponding degrees API	Range of group (degrees API/60°)	Products normally in group
0	.00035	6	Up to 14.9	Heavy crude oils
1	.0004	22	15.0 to 34.9	Light crude oils Residual fuel oils Lubricating oils
2	.0005	44	35.0 to 50.9	Kerosene Heavy diesel fuels Solvents Jet fuels
3	.0006	58	51.0 to 63.9	Motor gasolines Light diesel fuels
4	.0007	72	64.0 to 78.9	Aviation gasolines
5	.0008	86	79.0 to 88.9	Liquefied gases
6	.00085	91	89.0 to 93.9	
7	.0009	97	94.0 to 99.9	

Table XVIII. Volume Correction Table for Petroleum Products

Observed temperature °F.	Group number and API gravity range at 60° F.							
	Group 0	Group 1	Group 2	Group 3	Group 4	Group 5	Group 6	Group 7

23. Factors Influencing Petroleum Requirements

The factors influencing petroleum consumption are as follows:

a. Displacement. By measuring the distance the center of an organization is to be moved, one can find how many miles each vehicle in an organization will have to move. Cross-country battle consumption is estimated at two and one-half times the consumption of movements over roads.

b. Vehicle-Per-Mile Consumption. Gasoline consumption per mile varies with the type of vehicle employed. Hence, it will be necessary to determine the number of each type of vehicle used for the movement.

c. Distance of Supply Installations. Certain vehicles of the organization must make round-trip supply movements. Since only 20 percent of the vehicles will make such movements, the estimated requirements of the supply vehicles may be obtained by multiplying the distance moved by the number of gallons required to move the organization and then taking 20 percent of the result.

d. Service. Supplemental daily requirements must be considered for the movement of vehicles within bivouac areas and on reconnaissance, the warming up of engines, and abnormal periods of low-gear operation. Under average conditions of operation, weather, road, and terrain, the

requirements can be estimated by using the consumption necessary to move all vehicles 10 miles over roads.

e. Loss Factor. When operating in a combat zone, an additional 10 percent of the total consumption figure should be included in the estimate to cover evaporation, spillage, and small combat losses.

f. Housekeeping. Additional daily requirements exist for administrative vehicles, kitchens, gasoline-powered equipment, and maintenance and testing of engines. When the organization is not on the march, these requirements are groupd in a composite daily requirement for the organization. When the organization is on the move, these factors, with the exception of kitchen requirements, are included in displacement and service factors. The kitchen requirement is figured on a daily consumption of 15 gallons per kitchen.

24. Petroleum Consumption Factors

Table XIX may be used as a guide for estimating petroleum consumption by Army vehicles and aircraft.

Table XIX. Petroleum Consumption Factors

a. Vehicles.

Vehicle	Vehicle fuel tank capacity (gal.)	Fuel [1] per 100 miles (gal.)	Oil [1] per 100 miles (gal.)	Gear lubricant per 100 miles (lb)	Miscellaneous greases per 100 miles (lb)

** Information not available.

25. Per-Man-Per-Day Method of Estimating Petroleum Requirements

The per-man-per-day method of estimating petroleum requirements is used in the early planning stages when definite information is not available on the number and types of vehicles. Because of the variables in organizational makeup, this method is seldom used below army level and never below corps level; although, once established for a given theater, the figure may be used for requisitioning purposes by smaller units. The gallons-per-man-per-day method is to be used as a guide only and not as a substitute for more exact computation. The consumption in gallons per man per day in various theaters would necessarily vary with terrain, climate, ratio between land and amphibious operations, and the employment of units using special vehicles and equipment. The figures given in table XX should be adjusted to fit each particular area as soon as experience shows any variance between these planning factors and actual usage. To compute estimated petroleum requirements, multiply troop strength by factors listed in table XX.

Table XX. Per-Man-Per-Day Method of Estimating Petroleum Requirements

a. Army Class III Supplies

Product	Gallons per man per day	Pounds per man per day
Mogas (90%)	3.000	18.309
Diesel (4%)	0.132	0.928
Engine oil (3%)	0.099	0.714
Gear lubricants (1%)	0.033	0.250
Grease (expressed in lbs)		0.066
Total		20.267

*b. Army Class IIIA Supplies**

Avgas 100/130	0.300	1.778
Avlube oils	0.003	0.22

* Air Force requirements for Class IIIA supplies must be obtained from the appropriate Air Force command.

26. Per-Vehicle-Per-Mile Method of Estimating Petroleum Requirements

The per-vehicle-per-mile method of estimating petroleum requirements is a more accurate method than the per-man-per-day method. It is used in operational stages when the numbers and types of vehicles are known. An example of estimating petroleum requirements using the per-vehicle-per-mile method is given below.

a. Problem. An army corps, consisting of three infantry divisions

and one armored division, is to make an assault on a target estimated to take 2 days. During the 2 days, the corps will first travel 60 miles to bivouac at the rear area boundary and then 15 miles in combat zone, with 10 miles under cross-country battle conditions. Estimate the fuel requirements for the 2 days.

b. Solution. Known transportation for infantry division (ROCID):

33	Tanks	@	1.7	gallons per mile	56
42	Tanks	@	2.9	gallons per mile	122
633	Trucks	@	.06	gallons per mile	38
1,205	Trucks	@	.224	gallons per mile	270
68	Motor carriages	@	1.3	gallons per mile	88
191	Tracked vehicles	@	1.25	gallons per mile	239
					813
	Multiply by 3 (number of divisions)				2,439

Known transportation for armored division (ROCAD):

360	Tanks	@	2.75	gallons per mile	990
865	Trucks	@	.06	gallons per mile	52
507	Trucks	@	.18	gallons per mile	91
37	Trucks	@	.22	gallons per mile	8
40	Motor carriages	@	1.5	gallons per mile	60
538	Tracked vehicles	@	1.7	gallons per mile	915
					2,116
	Total gallons for 1 mile, all divisions				4,555
	Total gallons for 75 miles				341,625
	Plus 10 miles cross country				432,725

(4,555 × 10 × 2 = 91,100)

27. Unit Method of Estimating Petroleum Requirements

The unit method is used on divisional or unit level for planning petroleum requirements when a number of typical divisions or units are to make a mass movement over roads. Table XXI gives an average consumption figure for moving a typical division, including all equipment and division trains, over 1 mile of road. When the division is not on the march, an average consumption of 4,000 gallons per day is used to cover administrative vehicles, power equipment, and kitchens for each division. When figured separately, each kitchen is estimated to consume 15 gallons per day. For further information, see FM 101–10.

Table XXI. Unit Method of Estimating Petroleum Requirements

Division	To move all vehicles 1 mile				Gasoline capacity	No. of organic fuel cans	No. of organic kitchens
	Vehicle fuel (gals.)	Engine oils (gals.)	Gear lube (lbs)	Miscellaneous greases (lbs)			
Airborne (ROTAD)	177.76	5.08	5.03	4.17	56,727	4,408	60
Armored (ROCAD)	2,123.6	66.2	38.0	43.3	585,701	29,041	98
Infantry (ROCID)	926.6	17.8	15.36	11.96	133,139	10,931	165

28. Experience Tables for Estimating Petroleum Requirements

The most accurate method of estimating petroleum requirements is based upon weekly experience tables, which more exactly reflect the variables of weather, terrain, organizational strength, and operational vehicles and equipment. These tables, when submitted weekly by each unit and compiled at the next higher headquarters, may be used for all levels of petroleum planning, and the figures used in the man-per-day, vehicle-per-mile, or unit methods can be adjusted accordingly. An allowance of 5 percent in tonnage is usually added for auxiliary equipment, such as ranges, and generators. Lubricants are estimated as a percentage, based on experience, of total gasoline reuqirements. A typical experience table may be developed as follows (table XXII):

Table XXII. Experience Tables for Estimating Petroleum Requirements

Vehicles		Total mileage for week	Gasoline		Lubricating Oil		Gear Lubes		Greases	
Number	Type		Per unit mile	Gallons	Percent factor	Gallons	Percent factor	Gallons	Percent factor	Pounds
400	Tank-type	28,000	1.0	28,000	4	1,120	1.5	420	2.5	700
320	Halftrack	22,400	.3	6,720	4	273	3.0	202	4.0	273
4,000	Trucks	96,800	.2	19,360	2	387	1.0	193	2.0	387
3,000	Auto-units	108,900	.1	10,890	3	327	1.5	163	1.5	163
	Total petroleum consumption for week ending		-----	64,970	-----	2,107	-----	978	-----	1,523

29. Storage

a. Bulk.

(1) *Permanent tanks.*

(*a*) *Description.* Bulk petroleum is usually stored at bulk storage facilities in bolted-steel tanks ranging in capacity from 100 to 10,000 barrels or more (42 U. S. gals. equal 1 barrel). Pressure and vacuum-release valves are supplied with all sizes of tanks. Table XXIII gives information on the gallon and barrel capacity, shipping weights, and cubages of the more common sizes of bolted-steel tanks.

Table XXIII. Data on Bolted-Steel Tanks

Approximate inside diameter (ft)	Height (ft)	Capacity (gals.)	Capacity (barrels)	Approximate net weight (lbs)	Cubic feet (packed)	Approximate gross weight crated (lbs)	Approximate volume displacement (cu ft)
9′2″	8	4,200	100	2,750	80	3,196	210
15′4″	8	10,500	250	5,600	--------	6,510	260
21′6″	8	21,000	500	9,760	144	11,712	350
29′8″	8	42,000	1,000	17,080	218	20,496	470
29′8″	24	126,000	3,000	27,840	--------	33,408	850
38′8″	24	210,000	5,000	39,000	890	44,000	1,064
54′11″	24	420,000	10,000	77,300	2,015	92,100	1,600

(*b*) *Measurement of liquid in vertical cylinder.* The contents in U. S. gallons of a vertical cylindrical tank, such as a steel storage tank, may be calculated by use of equation $V = \pi r^7 h$ (7.481).

Note. V = Volume (U.S. gallons).
π = 3.1416.
r = Radius in feet.
h = Height of liquid level (innage) in feet.
7.481 = Conversion factor to U.S. gallons.

(2) *Temporary tanks.* Temporary tanks are used to store small quantities of petroleum products for relatively short periods. They are generally used at forward petroleum supply points but can also be used wherever required in the petroleum supply system (table XXIV).

(*a*) *Collapsible tanks.* The 900-, 3,000-, and 10,000-gallon collapsible liquid fuel tanks are constructed of heavy fabric impregnated with petroleum-resistant rubber. Each tank is equipped with a hose and valve assembly through which it is filled and emptied. The light weight and compactness of the tanks facilitate their transportation to forward areas for petroleum storage.

(*b*) *Skid-mounted tanks.* There are two types of skid-mounted fuel tanks: the 1-compartment 600-gallon tank; and the 1- and 2-compartment 750-gallon tank (limited standard). The tanks are of welded steel construction and are equipped with inlet and outlet fittings and pressure vent. Two 600-gallon tanks can be carried in the bed of a standard 2½-ton 6 x 6 cargo truck.

Table XXIV. Skid-Mounted and Collapsible Tanks for Petroleum Products

Item description	Dimensions of filled tanks (ft)			Weight (lbs)			Cubic feet[a]		No. that can be carried on a 2½-ton truck
	Length	Width	Height	Empty	Filled[b]	Crated	Crated	Rolled up	
Tank, metal skid-mounted, 600-gallon capacity.	6	6	4	800	4,500	1,800	223	------	[c]2
Tank, metal, skid-mounted, 750-gallon capacity (ltd std):									
One - compartment.	6	6	4⅜	1,000	5,600	2,000	237	------	1
Two - compartment.	6	6	4⅜	1,100	5,700	2,100	237	------	1
Tank, fabric, collapsible, 900-gallon capacity.	6	6½	3	165	5,650	195	14	14	33
Tank, fabric, collapsible, 3,000-gallon capacity.	20	6½	3	228	18,500	265	22	22	22
Tank, fabric, collapsible, 10,000-gallon capacity.[d]	42	12	4	800	61,800	950	30	30	5

[a] Average.
[b] Filled with gasoline; weights increase when filled with heavier petroleum products.
[c] Only one tank can be carried on a 2½-ton truck for off-highway transportation.
[d] Tank assembly contains a 4-inch hose manifold, which weighs 660 pounds and has a storage volume of 49 cubic feet.

b. Packaged.

(1) *Dimensions of containers.* Table XXV gives weights, dimensions, and planning factors of standard petroleum containers. For storage and pipeline computations, bulk petroleum is usually measured in barrels of 42 gallons each or in long tons. For packaged petroleum products, ocean shipping is based on the measurement ton (40 cu ft). The capacity of vehicles for carrying filled containers is based upon authorized loads. When overloads are authorized, these quantities may be increased to the cubic capacity of each vehicle or to 100 percent overload, whichever limit is reached first.

Table XXV. Data on Standard Petroleum Containers

Container	Empty weight (lbs)	Average weight when filled (lbs)					Dimensions (in.)			Cubic feet		Packages[1]		Capacity of vehicles for carrying filled containers[1]	
		Gasoline, automotive combat[2]	Kerosene	Diesel fuel	Lubricating oil, engine	Grease	Length	Width or diameter	Height	Actual	Planning factor	Short ton	Measurement ton	1½-ton truck or trailer[2]	2½-ton truck[2]
55-gallon drum, 16-gage (std).[3]	70	400	443	457	479	------	------	23 7/16	35 1/16	8.8	11.18	5.01	3.58	7	12
55-gallon drum, 16-gage (ltd std).	78	401	438	451	472	------	------	24 1/8	34 3/4	9.2	11.71	4.98	3.42	7	12
5-gallon can, gasoline	10.5	41	------	------	------	------	13 3/4	6 3/4	18 1/2	0.99	1	48	40	73	122
5-gallon cylindrical drum	11	------	45.2	46.2	49.2	66	------	11 1/2	13 9/16	0.81	1	40.7	40	71	101
Case, twenty-four 1-quart cans.	15	------	------	------	59.6	------	18	13	12	1.6	2	33.5	20	50	83
Case, six 5-quart cans	20	------	------	------	75.7	------	22	14	10	1.8	2	26.4	20	40	66
35-pound pail[4]	5.25	------	------	------	43.1	40.25	------	12	13 1/4	.87	1	49.6	40	75	124
120-pound drum	16	------	------	------	139.7	136	------	14 7/8	26 3/4	2.7	3.4	14.7	11.76	22	36

[1] Data for 55-gallon drums and 5-gallon gasoline can are based on average weight of automotive combat gasoline; data on 35-pound pail and 120-pound drum are based on average weight of grease; data on all other containers are based on average weight of lubricating oil, engine.

[2] Capacity of vehicles for carrying filled containers may be increased up to cubic capacity or 100 percent overload (whichever is reached first) when vehicles are in use on highways and roads.

[3] The standard 55-gallon drum (Specification PPP–D–729, Amendment No. 1) has an authorized capacity of 54 gallons for products with flash point of less than 80° F., or 55 gallons over 80° F. The specification shows maximum capacity of 57.75 gallons. The drum is identified by the letter "O" embossed on the head of the drum.

[4] Data based on average empty weight of class 1 pail. The average empty weight of the class 2 pail is 5.75 pounds.

(2) *Layout of stacking areas.* It is extremely important to prevent the possibility of error in product identification. One of the most effective means of accomplishing this is to provide exclusive stacking areas for each product and type of package. This also aids in taking inventory. Exact layout and size of stacking area must be determined by evaluation of the local conditions and normal safety requirements. In order that the entire stock of one product will not be lost by attack or fire, where a large concentration of supplies is to be stored, there should be adequate dispersion. This is best accomplished by using a "block" system of segregation (TM 10–1101).

(*a*) *Aisles and firebreaks.* Adequate space should be provided for aisles and firebreaks within the stacking area. Between units of several 55-gallon drums, 4 to 5 feet for aisles should be provided. Wider aisles should be planned to accommodate the equipment, where heavy handling equipment is to be used in stacking the drums. Aisles, 15 to 50 feet wide, should be provided between sections of several units of containers. Firebreaks, 50 to 150 feet wide, should be provided around blocks of several sections.

(*b*) *Typical layouts.* In a typical layout of a stacking area for 5-gallon cans, each block might be composed of nine 50-foot-square sections with 30-foot aisles between sections. In a typical block layout of a stacking area for 55-gallon drums, blocks are composed of 55-foot-square sections rather than 50-foot-square sections, and each section is divided into 6 parallel units with 4-foot aisles between units.

30. Transportation

a. Tanker. Ship tankers range in capacity from 6,500 to 700,000 barrels and in speed from 5 to 18 knots. The T–2 class, with an average capacity of 138,000 barrels (or 5,796,000 gals.), is the most commonly used military tanker.

b. Pipeline. Pipelines should be utilized whenever possible to transfer bulk liquids from one storage dispensing point to another as they are the most efficient overland means for this task. There are four standard pipelines with nominal inside diameters as follows:

(1) *4-inch.* This line has a normal design capacity of 355 barrels (14,910 gals.) per hour.

(2) *6-inch.* This line has a normal design capacity of 785 barrels (32,970 gals.) per hour.

(3) *8-inch.* This line has a normal design capacity of 1,355 barrels (56,910 gals.) per hour.

(4) *12-inch.* This line has a normal design capacity of 7,150 barrels (300,300 gals.) per hour.

c. Pump Units.

(1) *Four-inch, 4-stage pump unit.* The 4-inch, 4-stage pump unit consists of a gasoline-engine power unit and a 4-stage centrifugal pump. It is used with 4- and 6-inch pipelines. At 1,800 revolutions per minute, the unit will pump 785 barrels per hour against 463 feet of head of 0.725 specific gravity gasoline. The maximum working pressure to which the pump may be subjected is 750 pounds per square inch or 2,390 feet of head of 0.725 specific gravity gasoline (63.7° API).

(2) *Six-inch, 2-stage pump unit.* The 6-inch, 2-stage pump unit consists of a gasoline-engine power unit and a 2-stage centrifugal pump which may be connected either in series or parallel. It is used with pipelines of 8-inch nominal diameter and larger or in booster pump stations. The unit can pump 1,730 barrels per hour at 380 feet of head of 0.725 specific gravity gasoline when operated with stages in series. When operating with stages in parallel, the unit has a capacity ranging from 2,860 barrels per hour at 160 feet of head to 3,570 barrels per hour at 170 feet of head. The maximum working pressure to which the pump may be subjected is 700 pounds per square inch, or 2,230 feet of head of 0.725 specific gravity gasoline (63.7° API).

(3) *Six-inch, single-stage, self-priming pump unit.* The 6-inch, single-stage, self-priming pump unit consists of a gasoline-engine power unit and a single-stage, self-priming centrifugal pump. The unit has two main uses: it serves as a *feeder pump* to supply the required suction pressure at the No. 1 pump station on the pipeline; and it serves as a *transfer pump* at tank farms and loading, unloading, and dispensing installations. It can pump 715 barrels per hour at 200 feet of head of 0.725 specific gravity gasoline. It provides a suction lift of approximately 30 feet at 50° F., and 3 feet at 135° F. The maximum working pressure to which the pump may be subjected is 207 pounds per square inch, or 660 feet of head of 0.725 specific gravity gasoline (63.7° API).

d. Motor. Bulk petroleum products are transported by motor in 5,000-gallon semitrailers and in 600-gallon skid-mounted tanks mounted on standard military vehicles such as 2½-ton trucks. Packaged petroleum products, such as drums, cans, and pails, are transported by standard military vehicles.

e. Rail. Tank cars, when available, are used to move bulk petroleum. The cars are metal cylindrical tanks, varying in capacity from 6,000 to 13,000 gallons. The United States Army 40-ton tank car has a nominal capacity of 9,900 gallons. Boxcars are used to transport packaged petroleum products. The dimensions of an average United States railway boxcar are 40½ feet long, 9 feet high, and 8½ feet wide. With

an average capacity of 20 to 50 short tons, such a boxcar can transport 1,300 filled or 2,500 empty 5-gallon containers, or 135 filled or 235 empty 55-gallon drums. Temporary storage tanks may be mounted on flatcars and gondolas and used to transport bulk petroleum products. Use of collapsible tanks for this purpose, however, should be limited to emergency situations (table XXVI).

Table XXVI. Transporting Filled Temporary Storage Tanks by Rail and Motor[1]

Type of transport	600-gallon skid-mounted tank		900-gallon collapsible tank[2]		3,000-gallon collapsible tank[2]	
	No. tanks	Total gal.	No. tanks	Total gal.	No. tanks	Total gal.

Gondola, 40-ton, low side.	6	4,500	5	4,500	1	3,000
Flatcar, 80-ton	7	5,250	6	5,400	2	6,000

[1] Based upon average cargo limits of typical military motor and rail carriers, and weight of tanks when filled with gasoline. Information pertains to on-or-off highway use, except that only one 600-gallon skid-mounted tank can be carried off the highway.

[2] Collapsible tanks are used to transport petroleum products in emergencies only.

[3] When overloads are authorized, one tank, filled, may be added to the load as given.

31. Handling and Testing Equipment

a. Engine-Driven Pumps. The 50- and 225-gpm gasoline dispensers are used to package bulk petroleum products in the field for issue to using units. They can also be used to transfer bulk petroleum products from one storage tank into another (table XXVII).

(1) *50-gpm dispenser.* The 50-gpm dispenser consists of a single-cylinder, 4-cycle, air-cooled gasoline engine, a self-priming, nonrecirculatory centrifugal pump, suction and discharge hose, two 1½-inch dispensing nozzles, and a carrying case. The unit is capable of pumping 50 gallons per minute against a 100-foot discharge head. One unit is issued as a component with the fuel-can-and-drum-cleaning machine. A hose and fitting kit, consisting basically of two Y-fittings, four discharge hose, and four 1-inch dispensing nozzles, is used when operating the 50-gpm dispenser to fill 5-gallon cans.

(2) *225-gpm dispenser.* The 225-gpm dispenser consists of a twin-cylinder, 4-cycle, air-cooled gasoline engine, a self-priming, nonrecirculatory centrifugal pump, suction hose, a discharge hose header system, twelve 1-inch dispensing nozzles, and a skid-mounted skeletal steel frame. The dispenser is capable of pumping 225 gallons per minute against a 50-foot discharge head.

b. Vehicular mounted dispensers.

(1) The truck, gasoline tank, 2½-ton, 6 x 6, LWB (1,200-gal. capacity) is equipped with a rotary, positive displacement pump. The pump on the M49 tank truck has a capacity of 80 gallons per minute; that on the M217 has a capacity of 60 gallons per minute. The pump is operated from power takeoff through front, intermediate, and rear drive shafts mounted under the tank body. A strainer body with strainer is incorporated in the pump for filtering fuel loaded or discharged through the pump. Discharge is through the delivery gate valve located under the pump compartment.

(2) The semitrailer, gasoline tank, 12-ton, 4-wheel, M131 (5,000-gal. capacity) is equipped with a self-priming, centrifugal pump with a 7⅞-inch impeller. The pump has a capacity of 250 gallons per minute. The pump is mounted on the right end of the platform in the rear cabinet. It is driven by the auxiliary engine through a flexible coupling and a bearing-mounted shaft. This shaft is inclosed in a shaft housing. The pump is connected by a cutoff gate valve and piping to the rear manifold. The pump discharge outlet is located at the top of the pump.

c. Hand-Operated Pumps. The three hand-operated petroleum products pumps are used primarily at the organizational level to dispense petroleum products from 55-gallon drums into 5-gallon cans or into

vehicle fuel tanks, and lubricating oil into smaller containers. Each pump is equipped with dispensing hose and nozzle or discharge outlet (table XXVII).

(1) *Rotary-type pump.* The dispensing pump, hand driven, rotary, for gasoline or kerosene, 12-gpm, is operated by a revolving crank and can deliver about 12 gallons per minute.

(2) *Piston-type pump.* The dispensing pump, hand driven, piston type, w/20-foot hose, 15-gpm is a lever-type fuel-dispensing pump, of reciprocating design. The pump, equipped with filter and water separator, is operated by a push-pull lever and can deliver approximately 15 gallons per minute. It is particularly suited for fueling aircraft and ground vehicles, and is classified standard for all except arctic use.

(3) *One-quart oil pump.* The dispensing pump, hand driven, piston type, 1 quart per stroke, is operated by a crank and delivers 1 quart per stroke. It is used to dispense lubricating oil.

d. Cleaning Machine. The fuel-can-and-drum cleaning machine consists of two sedimentation tanks equipped with 5-gallon-can-cleaning equipment, two 55-gallon-drum-cleaning assemblies, suction hose, pressure hose, and a 50-gpm dispenser. The machine is capable of cleaning about 4,000 5-gallon cans or 800 55-gallon drums in an 8-hour operating day (table XXVII).

e. Testing Equipment. Petroleum-testing equipment is used by specially trained personnel to maintain quality control of petroleum products used by the Army (table XXVII).

(1) *Testing kit.* The portable petroleum-testing kit is used to perform a limited number of quality control and identification tests in the field. It is designed to be carried in any organizational vehicle, and for short distances by two men. In addition to the test apparatus it contains sampling and gaging equipment.

(2) *Mobile laboratory.* The mobile petroleum laboratory is housed in a van-type, 8½-ton, 2-wheeled semitrailer. It contains the testing equipment and apparatus necessary for making the standard qualitative tests on petroleum products. Some of the units are equipped with a specially designed knock engine for determining octane ratings of gasoline-type fuels. The utility equipment includes a space heater, air compressor, vacuum pump, and water pump. A 4- to 5-ton tractor truck is used to pull the trailer on land. For air transport aboard a C–119 cargo aircraft the front and rear dollies must be removed. The laboratory is designed to operate with an auxiliary, trailer-mounted, 30-kilovolt-ampere, 125–250-volt, alternating-current, 3-phase, 60-cycle generator unit M7A1 weighing 4,500 pounds, dimensions of which are 130 inches long, 62 inches wide, and 84 inches high.

CHAPTER 5
WAREHOUSING

32. Estimating Requirements

The average net usable space in any warehouse may be estimated roughly as 60 percent of the total gross space. This leaves roughly 24 percent for aisles, lost space, and other factors and an additional 16 percent as a safety factor.

a. Determining Square Foot Allocation. To determine the number of square feet of floor space required to store 1 ton, divide the weight in pounds per ton by the allowable floor load. To determine the total number of square feet required, multiply the number of tons of supplies to be stored by the square feet per ton. For example, assume that the floor load allowed per short ton of supplies is 250 pounds per square foot. Then the approximate net storage space required per ton is 8 square feet (2,000 ÷ 250). The total number of square feet of storage space for 40 tons (assumed) would be 320 (40 x 8).

b. Determining Maximum Stacking Height. Assume that certain supplies (40 tons) consist of 50-pound boxes and that each box occupies 3.5 square feet of floor space, 250 pounds per square foot being the allowable floor load. Then the load per square foot is approximately 14.3 pounds (50 ÷ 3.5). The approximate number of boxes to be stored in one column would be 17 (250 ÷ 14.3).

c. Floor Loading.

(1) Safe warehouse floor loads are normally determined by reference to the building plans on which the floor capacities in pounds per square foot are usually designated. In all cases where building plans are not available or where the plans do not indicate safe floor loads or where the accuracy of the stated floor loads is doubtful, the installation engineer must be brought in to establish floor load capacity.

(2) Loading on floors should be distributed so that the weight bearing on any single square foot does not exceed the load capacity of that square foot. For instance, a 16- by 16-foot warehouse bay, with a safe load capacity of 250 pounds per square foot, may be evenly loaded to a total of 64,000 pounds (16 x 16 x 250).

(3) In certain instances, overloading of portions of a floor area to compensate for adjacent vacant or underloaded portions is permissible and is recommended whenever space is limited. The following may be used as a guide to safe overloading:

(*a*) In wood frame construction, where the normal storage space of a floor area is reduced by narrow aisles, the remaining storage space may be overloaded by an amount equal to the capacity of the aisles provided that the aisle runs at right angle to the floor support and that the excess load is uniformly distributed over the remaining portion of the bay. For example, a 16- by 16-foot bay whose safe floor capacity is 250 pounds per square foot can be loaded to a total of 64,000 pounds. A fire aisle 2 feet wide running the full length of the bay would reduce the storage space by 32 square feet, leaving a remaining area of 224 square feet for storage. Provided that this aisle runs at right angle to the floor supports, the remaining area could safely be loaded at the uniform rate at 64,000 divided by 224 or approximately 285 pounds per square foot. When the aisle runs parallel to the floor supports or is used for the transportation of supplies or the movement of mechanical equipment, compensation will not be made and the remaining space in the bay will not be loaded beyond the rated space capacity.

(*b*) In wood frame construction, when a bay is to be loaded unequally, it can normally be loaded to its full capacity provided that no part is overloaded in excess of 20 percent and that the dividing line of the unequal loading is at right angle to the floor support—that is to say, that the floor joists run out from the underloaded portion and through the overloaded portion. For example, a 16- by 16-foot bay with a total safe load capacity of 64,000 pounds may be loaded on the side of a line at right angle to the floor joists with 38,400 pounds of supplies and on the other side with 25,600 pounds. If the dividing line of unequal loading runs parallel to the floor support, the maximum load per square foot may not exceed the rated safe load.

(*c*) In reinforced concrete flat slab construction, where a portion of the floor is left unloaded in order to provide aisle space or for other reasons, the remaining portion of the floor can sustain an overload provided it does not exceed 33⅓ percent over any appreciable portion of the floor.

(4) The maximum capacity of forklift trucks which may be safely operated on a warehouse floor of a given live load can be determined as follows:

(*a*) Floors having a safe live load capacity of 250 pounds per square foot will in general support with safety the operation

of loaded forklift trucks whose capacity does not exceed 4,000 pounds. The floor space adjacent to aisles over which the trucks travel will not be loaded beyond its rated safety load and no other concentrated loads will be permitted in aisles when the trucks are operating.

(*b*) Forklift trucks exceeding 4,000-pound capacity will be divided into two classes in determining floor safety for their operation. First, trucks having close spacing of wheels or tricycle arrangement of wheels, or narrow trucks with short wheelbase, require that each individual floor be analyzed to determine whether the trucks can operate safely. Second, trucks having a width of 3 feet or greater and a wheelbase of 5 feet or greater may operate safely in reinforced concrete buildings or steel frame buildings with reinforced concrete floor slabs, on floors designed for 350 pounds per square foot or where the framing can support a concentrated load of 2,500 pounds distributed over an area 2.5 feet square.

(*c*) An allowance for impact of 15 percent of the total truck load will be added in all computations for determining safe loads on floors.

33. Storage Data

Computations used in table XXVIII are gross and include aisles and fire aisles. They are based on 8-foot stacks. An example of the use of the computations follows: To determine the amount of covered storage space required to maintain a 10-day level of supply of field ration A for 15,000 men, refer to *a* in table XXVIII, from which the figure .0556 is obtained. Multiply .0556 by 15,000 and the result is 834 square feet for 1 day. For a 10-day level of supply, 834 square feet multiplied by 10 equals 8,340 square feet. The same procedure is applied to determine the amount of open or refrigerated space required. In determining the amount of open storage space, a dispersion factor should be applied to the open storage space computed from table XXVIII. A dispersion factor of 40 square feet per 1 square foot storage space is usually required for protection against aircraft. For example, assume that three stacks are being set up in open storage and that the number of square feet of storage space in the stacks is as follows: 200, 250, and 300—a total of 750 square feet. To disperse the stacks properly, 40 square feet of space is allowed for each foot of storage space. Therefore, 750 square feet multiplied by 40 square feet equals 30,000 square feet of area required for open storage. Local conditions, terrain features, and natural camouflage may alter the dispersion factor considerably. In many instances, a greater or smaller dispersion factor may be applied, depending upon the conditions prevailing at a given site.

*Table XXVIII. Storage Space Requirements (Sq Ft)**

Type of supply	Covered	Open	Refrigerated	Total
a. Per man per day.				
Field ration A	.0556	.0415	.0264	.1235
Operational ration B	.0329	.0493		.0822
Clothing and equipage	.0146	.0019		.0165
Regulated items	.0014	.0007		.0021
Total	.1045	.0934	.0264	.2243
b. Per man per 30 days.				
Field ration A	1.668	1.245	.792	3.705
Operational ration B	.987	1.479		2.466
Clothing and equipage	.438	.057		.495
Regulated items	.042	.021		.063
Total	3.135	2.802	.792	6.729
c. Per 20,000 men per day.				
Field ration A	1,112	830	528	2,470
Operational ration B	658	986		1,644
Clothing and equipage	292	38		330
Regulated items	28	14		42
Total	2,090	1,868	528	4,486
d. Per 20,000 men per 30 days.				
Field ration A	33,360	24,900	15,840	74,100
Operational ration B	19,740	29,580		49,320
Clothing and equipage	8,760	1,140		9,900
Regulated items	840	420		1,260
Total	62,700	56,040	15,840	134,580

* Temperate zone.

34. Paulins

a. Types.

(1) *Canvas.* Canvas paulins for ordinary storage requirements are normally provided in four sizes—20 by 20 feet, 20 by 40 feet, 12 by 17 feet, and 17 by 40 feet. Other sizes currently in use, when worn out, will be replaced by one of the above sizes. Consideration must be given to the sizes of paulins available before determining the size of the stacks to be made.

(2) *Paper.* Brown-skin or paper paulins are most commonly procured in size 15 by 60 feet. Actually this size is made up of five 3- by 60-foot sections sewed together with overlapping seams. Various other sizes may be procured or cut by the using agency. Brown-skin or paper paulins have the ad-

vantage of being much lighter than other covers, but care must be taken to place them rather than pull them over the stack. Paper paulins require more care in lashing to eliminate the possibility of tearing by the wind.

b. Computing Paulin Requirements for Covering Stacks. Generally, two paulins will be necessary to cover a stack. The following formulas are useful in computing the relationships of stack sizes and paulin coverages.

One-half of paulin length equals the *stack length.*

One-third of paulin length equals the *stack width.*

Paulin width—($3\sqrt{\frac{1}{2}}$ of the stack width + 3) equals the *side wall height.*

The length multiplied by the width of the stack equals the *square feet* of ground space occupied.

In using the formula for computing *side wall height,* the following square roots may be used:

$\sqrt{1}$ equals 1.0000
$\sqrt{2}$ equals 1.4142
$\sqrt{3}$ equals 1.7321
$\sqrt{4}$ equals 2.0000
$\sqrt{5}$ equals 2.2361
$\sqrt{6}$ equals 2.4495
$\sqrt{7}$ equals 2.6458
$\sqrt{8}$ equals 2.8284
$\sqrt{9}$ equals 3.0000
$\sqrt{10}$ equals 3.1623

35. Materials Handling Equipment

a. Forklift Trucks.

(1) *Description.* A forklift truck is a front-wheel drive, rear-wheel steer materials handling vehicle designed to load, unload, transport, and stack unit loads of supplies either indoors or outdoors. A forklift truck normally used for interior warehouse duty is equipped with cushion (solid rubber) tires and a forklift truck normally used for outdoor storage is equipped with pneumatic tires. The load is carried on the front of the truck on a 2-tined fork and lift carriage assembly that is raised and lowered by a hydraulic lifting mechanism. The forks and their supporting frame (upright assembly) can be tilted forward or backward from the vertical to assist in picking up loads and balancing lifted loads in transit.

(2) *Capacity.* Forklift truck capacity is rated on the weight of

the load that can be carried and the height to which the load can be lifted. The lifting heights range from 100 to 210 inches. A forklift truck used for interior warehouse duty has a lifting capacity of 2,000 to 6,000 pounds and one used for outdoor storage has a lifting capacity of 4,000 to 15,000 pounds.

(3) *Power.* A forklift truck may be powered by a gasoline engine or a battery-driven electric motor. A truck equipped with a gasoline engine may be used for either indoor or outdoor storage and a truck equipped with an electric motor is designed exclusively for indoor operation. In a gasoline-engine-driven forklift truck, power developed by the engine may be transmitted to the drive axle and wheels by means of a conventional clutch and transmission or by such a special device as a fluid coupling or an electro-magnetic drive unit. On a model identified by the letters RS, the engine has been modified by the use of radio-suppression devices.

(4) *Hydraulic mechanism.* A hydraulic mechanism is provided on both gasoline- and battery-powered forklift trucks as the means of lifting the forks and lift carriage on which the palletized loads are placed. On trucks designed primarily for indoor warehousing operations, the hydraulic mechanism normally allows a free lift of several feet—free lift being the distance the forks may be moved upward before extension of the inner slides beyond the top of the mast increases overall truck height. Such design results in the more effective use of available storage space and allows loads to be tiered in closed top trucks and boxcars as well as under balconies and other low-ceilinged areas. Hydraulic equipment is also used to provide trucks designed for outdoor operation with hydraulic (power) steering and hydraulic (power) braking.

(5) *Application.* The primary advantage of the forklift truck is its extreme flexibility. The most successful and efficient use of the truck is in handling palletized unit loads of 2,000 pounds or more. It is often used, however, to move items that cannot be palletized because of their size or shape. The forklift truck enables maximum use of cubic space, simplifies inventories and inspections, and permits rapid relocation of supplies. The full potentialities of the truck may be realized when it is used in conjunction with a tractor-trailer train whenever the horizontal distance the load is to be carried is more than 250 feet.

(6) *Types and capacities.* Types and capacities of forklift trucks are given in tables XXIX and XXX.

Table XXIX. Types and Capacities of Solid or Semisolid Rubber-Tired Forklift Trucks

Load capacity (lbs)	Lift height capacity (in.)	Collapsed mast height (in.)	Free lift (in.)	Fork length (in.)	Power	
					Gasoline	Battery
2,000	100	68	42	36	(*)	(*)
2,000	127	83	57	36	(*)	(*)
4,000	100	68	42	40	(*)	(*)

6,000	127	83	57	40	(*)	(*)
6,000	168	113	6	40	(*)	(*)

Table XXX. Types and Capacities of Pneumatic Rubber-Tired Forklift Trucks

Load capacity (lbs)	Lift height capacity (in.)	Collapsed mast height (in.)	Free lift (in.)	Fork length (in.)
2,000	127	83	57	36 or 40
4,000	144	91	57	40
6,000	127	83	57	40
6,000	168	115	6	40
*10,000	210	150	2	48
15,000	210	153	2	48

* Limited standard.

b. Warehouse Tractors.

(1) *Description.* A warehouse tractor is a front-wheel steer, rear-wheel drive, self-propelled vehicle. Warehouse tractors are available in two distinct types: 3-wheel models with a short turning radius and 4-wheel models which may be equipped with dual wheels. Either type may be equipped with solid rubber or pneumatic tires.

(2) *Power.* Warehouse tractors may be powered by gasoline engines or battery-driven electric motors. Those powered by gasoline engines may be equipped with solid rubber or pneumatic tires for indoor and outdoor operation. Those powered by battery-driven electric motors are normally equipped with solid rubber tires for indoor operation exclusively. Gasoline-powered models may vary in capacity from 2,000- to 7,500-pound drawbar pull; electric-powered models from 2,000- to 4,000-pound drawbar pull.

(3) *Use.* The warehouse tractor has sufficient power to pull loads of a practical size, yet it is small and maneuverable enough to move in the limited space of warehouses and storage areas. This tractor may be used for direct drag-towing of materials

along the floor on skids, for pulling one or two trailers, or for towing a train of 6 to 25 trailers. Where the volume of materials and the regularity of schedules warrant its use, the trailer train is the most practical and economical method of moving materials with a warehouse tractor. In this system the tractor acts as a locomotive for a trackless train of trailers. The train moves through the storage area, spotting trailers at intervals where they are to be used and picking up trailers that are to be moved.

(4) *Types, capabilities, and capacities.* Types, capabilities, and capacities are given in table XXXI.

Table XXXI. Types, Capabilities, and Capacities of Warehouse Tractors

Drawbar pull (lb)	No. of wheels	Type tires
Gasoline-powered:		
2,600	4	Pneumatic
4,000	4	Pneumatic
7,500	4	Pneumatic
Electric-powered:		
2,000	3	Solid
4,000	4	Solid

c. *Wheeled Cranes.*

(1) *Description.* The wheeled crane is a power-driven, mobile unit that can operate in limited spaces to lift, transport, and deposit materials that cannot be readily handled by other types of materials handling equipment. The crane may be equipped with solid rubber or pneumatic tires or a combination of these, depending upon the type of power provided. Those equipped with solid rubber tires are normally used for indoor storage operations. They may have either front or rear wheel drive.

(2) *Types.* Wheeled cranes are available in two types—fixed boom and sluing boom. The fixed boom crane is usually mounted on a standard tractor unit with the boom projecting over the front wheels. On this type, the boom is an integral part of the crane frame and can be swung only by steering the tractor in which it is mounted. The sluing boom crane is usually a specially designed, self-propelled vehicle that may be called a crane truck. On this type, the boom and hoisting unit are so mounted that they may be swung without moving the crane chassis. On the fixed boom type, the hoisting and topping units are mounted at the rear of the tractor where the controls are easily accessible to the operator. Weights are set in the rear of the frame, or in the rear wheels to counterbalance lifted loads. On the sluing boom type, most of the load is

supported by the drive wheels, a design that allows the engine to be placed in the rear of the unit as a part of the counterweight.

(3) *Power.* Wheeled cranes may be powered by gasoline engines or by battery-driven electric motors. Those powered by gasoline may be equipped with either solid rubber or pneumatic tires and usually have a capacity from 6,000 to 10,000 pounds. Those powered by battery-driven electric motors are normally equipped with solid rubber tires and normally have a capacity of 6,000 pounds.

(4) *Use.* Wheeled cranes are designed with varying capacities and can handle most lifting jobs found in storage areas. The crane is particularly useful because it handles loads which are of shapes and sizes that are moved with difficulty. It can reach loads in places inaccessible to other types of materials handling equipment and is flexible in use because it lifts and carries. It is small and compact and can be used in limited spaces and in the congested aisles found in small warehouses and storage areas.

d. Straddle Trucks.

(1) *Description.* The straddle truck is a gasoline-engine-driven materials handling vehicle with a high, inverted framework that enables it to pass over and straddle the load to be picked up and transported. The motor and the operator's compartment are located at the top of the vehicle. The 4 wheels are located at the extreme corners of the truck and bear the frame on 4 vertical shafts, or masts. All 4 wheels, which may be steered, are equipped with pneumatic tires. The straddle truck is capable of speeds up to 35 miles per hour and may be used on highways as well as in storage areas. The truck has a capacity of 30,000 pounds.

(2) *Use.* The straddle truck was originally designed to handle lumber, and while this remains a principal use, the truck may be used to carry such items as girders, rods, and pipes. It may also be used for carrying containers of bulk materials, awkward-shaped packages, and heavy materials which other industrial trucks would have difficulty moving.

e. Warehouse Trailers.

(1) *Description.* Warehouse trailers are not self-propelled and must be used in conjunction with some other form of materials handling equipment. Usually they are 4-wheeled caster-type loading devices. They are made either of steel or wood, depending on the size of load to be carried. They may be equipped with solid or pneumatic tires. Solid tires are used for indoor warehouse duty while pneumatic tires are used for outside warehouse duty. Steering may be of caster or fifth wheel type.

(2) *Use.* Warehouse trailers are generally used with tractors to form the tractor-trailer system of warehouse work. When loads cannot be permanently palletized or easily moved with the forklift trucks, it is best to load on trailers and haul with tractor. Trailers are useful in warehouses where loads must be constantly moved.

(3) *Types and capacities.* Types and capacities are given in table XXXII.

Table XXXII. Types and Capacities of Warehouse Trailers

Type	Load capacity (lbs)	Platform size		Tires
		Width (in.)	Length (in.)	
Caster steering	4,000	36	84	Solid
Fifth wheel steering	6,000	48	108	Pneumatic
Fifth wheel steering	20,000	72	144	Solid

f. Powered Conveyors.

(1) *Description.* A power-belt conveyor is a continuous motor-driven belt supported in a frame, designed to move materials horizontally or up an incline. In the frame, the belt is supported either by idling rollers or steel plates, spaced between the driving rollers. The conveyor consists of a driving section with the power unit, normally an electric motor, built into the frame and as many driven sections as may be required. The power-belt conveyor is a portable unit, the frame being supported by casters or wheels. The belt may move at a speed of 200 feet per minute, but the most common speed for practical package handling is approximately 100 feet per minute. This type conveyor is capable of moving packages up an incline of about 25 percent, and if materials are to be moved up a steeper incline, supporting cleats must be added to the belt.

(2) *Use.* Power-belt conveyors may be used to load and unload trucks and freight cars, to move packages from one level to another, and to help in stacking and piling in warehouses. They may be inserted as sections in gravity-type conveyors to act as pushers. They can handle cartons and boxes as well as bags. When both the upper and lower sections of the belt are used, the same conveyor can move materials in opposite directions simultaneously.

(3) *Types.* The following standard types of power-belt conveyors are available:

(*a*) Conveyor, belt, portable, power unit, electric, 20-foot driving section.

(*b*) Conveyor, belt, portable, 20-foot driven section.

CHAPTER 6
PACKAGING AND PACKING

36. Processing, Packaging, and Packing

a. Cleaning. Articles subject to corrosion or other deterioration must be cleaned thoroughly in order that the preservative which is to be applied later may be effective. Cleaning may be accomplished by use of any applicable process, the most common of which are the processes and combinations of processes listed in (1) through (16) below. The choice of a cleaning process is determined by such factors as the degree of cleanliness required, the type of contaminant on the article, and the nature of the article's material content.

(1) *Any petroleum solvent.* Removal of oil and grease from certain objects may be accomplished by immersing them in a petroleum solvent such as Stoddard solvent (dry cleaners' naphtha).

(2) *Single petroleum solvent in two steps.* When a high degree of cleanliness is required, two tanks of the same solvent are employed. One tank is used for initial cleaning; the other, for rinsing.

(3) *Single petroleum solvent applied by scrubbing or wiping.* The article is cleaned by applying the petroleum solvent with a brush or cloth. This method is employed for items too large to be immersed in the solvent tank or items where patch or spot cleaning only is desired.

(4) *Two-solvent immersion with perspiration removal.* The item is first immersed in a petroleum solvent to remove oil and grease; then, in an approved perspiration solvent to remove inorganic matter such as salts; and finally in another petroleum solvent tank for purposes of rinsing.

(5) *Solvent spray.* The petroleum solvent is sprayed on the part. The force of the spray also removes insoluble particles on the item. If perspiration salts are believed present, a perspiration solvent spray is then used. A petroleum solvent rinse must be employed after use of the perspiration solvent spray.

(6) *Vapor-degreasing solvent.* The article is suspended in the vapors emitted from a boiling tank of a chlorinated solvent. This method removes contamination so completely that pre-

servative must be immediately applied to prevent the swift deterioration or corrosion that can occur as an aftermath.

(7) *Perspiration and fingerprint removal.* Immersion in perspiration removal solvent must be followed by rinsing in petroleum solvent unless the perspiration solvent is methanol.

(8) *Alkaline immersions.* Alkaline immersions containing soaps or wetting agents are appropriate. The immersion must be followed by a hot water rinse.

(9) *Alkaline spray.* The soap or wetting agent should not be used in the alkaline spray as it causes undesirable foaming. The use of a simple one-compound cleaner is recommended. Hot water rinse should follow.

(10) *Alkaline electro-cleaning.* This method can be used only if proper equipment is available.

(11) *Emulsion soak.* The emulsion solvent is a mixture of emulsifier and solvent. The soaking should be followed by a cold water spray and hot water rinse.

(12) *Emulsion spray.* The spray accomplishes the cleaning and rinsing process in one operation.

(13) *Steam cleaning.* Steam is applied under pressure to clean the surface.

(14) *Sand blasting.* Sand propelled by air pressure cleans the surface.

(15) *Vapor blast* (liquid honing). Vapor containing abrasive particles is directed at high pressure at the surface to be cleaned.

(16) *Soft grit blast.* Relatively soft abrasives, which are air-pressure propelled at high velocity, are directed at the surface to be cleaned.

b. Removing Rust. Where necessary, remove rust with abrasive cloth, crocus cloth, or corrosion removing compound (metal cleaner, condition and rust remover), as applicable. In using any of the above methods, make sure that all surfaces to which the rust remover was applied are thoroughly rinsed with a solvent which will remove all of the cleaning agent. This is important as most rust removers contain chemicals which can harm metals if allowed to remain for an extended period of time.

c. Drying.

(1) Immediately after cleaning, the item should be thoroughly dried to evaporate cleaning solutions and to remove any residue moisture.

(2) Acceptable methods of drying are—

(*a*) Prepared compressed air.

(*b*) Oven.

(*c*) Infra-red lamps.

(*d*) Wiping.

d. Preservation and Unit Protection.

(1) Unit protection procedures should be performed as a continuous operation whenever possible.

(2) A choice of procedure for unit protection is determined by the nature of the material and the degree of protection required.

(3) There are six basic methods of preservation which are not independent of each other but may be used as submethods or combinations to meet the requirement of a specific problem.

(*a*) Preservative coating (with greaseproof wrap when required).

(*b*) Water-vaporproof package (contains 7 submethods or procedures).

(*c*) Strippable protective coating (contains 3 submethods or procedures).

(*d*) Water-resistant package with or without preservative (contains 5 submethods or procedures).

(*e*) Water-vaporproof package including desiccant and with preservative when required (contains 5 submethods or procedures).

(*f*) Package for mechanical and physical protection only.

(4) Where it is necessary to paint, apply rust-inhibitive synthetic primer to surface before painting.

(5) Where it is not necessary to paint, apply rust-preventive film on the item.

(6) Apply a greaseproof paper wrap to keep soft drying corrosion preventive film on the item. This wrap is not mandatory if a hard drying preservative is used and allowed to dry. Wrapping should be suitably secured.

(7) Select shipping container as applicable, considering maximum allowable size of container, weight of contents, and practicability of the container for the prescribed level of packaging or packing; that is, suitability for immediate use, domestic storage, or oversea shipment.

(8) Use cushioning materials (wood, excelsior, crepe cellulose wadding, hair felt, flexible corrugated paper) for such conditions as protection of finished surfaces against abrasion, protection of small projections on articles, filling of voids, and so on. Materials used directly against finished surfaces must be chemically neutral and free from abrasive qualities.

(9) Block, brace, fasten, or otherwise secure articles that do not fill the shipping containers so as to prevent movement in the container. Blocking and/or bracing shall not be secured to the outer container by means of end-grain nailing. Portions of the blocking and/or bracing coming in direct contact with unpainted or preserved surfaces shall be covered with a greaseproof waterproof material. Brace by fastening wood or steel members to the shipping box in one direction, crosswise, or by

cutting out portions of braces or supports to fit around a part of the machine. Bracing makes the article virtually a part of the box itself. Apply bracing to a part or parts of the article that will not be damaged by impact or by a blow sufficient to distort the box.

(10) Articles such as machines or sub-assemblies should, when possible, be bolted to the container. In bolting, attach the article rigidly to the base of the container with the bolts running through the skid and container base.

(11) Use linings for textile bags, barrels, and drums where necessary to give protection against sifting, contamination, and entrance or loss of water.

(12) Where necessary for waterproofing, use lining for boxes, crates, and other containers. Linings should be in bag form unless panel linings are required because of interior bracing and blocking.

e. Levels of Packing and Preservation. The Department of Defense has established uniform levels of packing and preservation for the Armed Forces. The application of these levels depends upon known use and storage factors as presented in AR 740–15.

(1) *Levels of preservation and packaging.*

(*a*) *Level A—military package.* Level A is preservation and packaging which provides protection against corrosion, deterioration, and physical damage during shipment, handling, indeterminate storage, and worldwide redistribution.

(*b*) *Level B—limited military package.* Level B is intermediate between levels A and C (below) and includes meeting of preservation and packaging requirements which are developed as a modification of the military package or as a separate entity for use under specific conditions.

(*c*) *Level C—minimum military package.* Level C is preservation and packaging which provides adequate protection against corrosion, deterioration, and physical damage during shipment from supply source to the first receiving activity which will put the property to immediate use. The supplier's commercial practices may be considered as conforming to level C if they meet the requirements of this level.

(2) *Levels of packing.*

(*a*) *Level A—military pack.* Level A is packing which will protect goods during shipment, handling, indeterminate storage, and worldwide distribution.

(*b*) *Level B—limited military pack.* Level B is packing which protects goods against damage during multiple domestic shipments, handling, and covered storage.

(*c*) *Level C—minimum military pack.* Level C is packing which protects against damage during direct shipment from the

supply source to the first receiving activity for immediate use. Generally, this level conforms with the applicable carrier's rules and regulations and may be the supplier's commercial practice if this practice meets the requirements of this level.

37. Types of Interior Containers

The types of interior containers are—

a. Fiberboard interior boxes.
b. Folding cartons.
c. Setup boxes.
d. Fiberboard cans and tubes.
e. Greaseproof, waterproof bags.
f. Metal interior containers.
g. Glass containers, plastic containers, and collapsible metal tubes.
h. Kraft paper bags.
i. Linings for textile bags, barrels, and drums.

38. Types of Exterior Containers

The types of exterior containers are as follows:

a. Sheathed nailed wood crates.
b. Unsheathed nailed wood crates.
c. Wood-cleated plywood boxes.
d. Nailed wood shipping boxes (styles 2, 2½, 3, 4, 5, and 6).
e. Wirebound shipping boxes.
f. Fiberboard shipping boxes.
g. Wood-cleated solid fiberboard boxes.
h. Tight barrels.
i. Slack barrels.
j. Slack kegs.
k. Metal drums.
l. Metal cans and pails.
m. Plywood drums.
n. Fiberboard drums.
o. Laminated shipping bags.
p. Multiwall paper shipping sacks.
q. Textile shipping bags.
r. Bales and bundles.
s. Pallets.
t. Skids.

39. Selecting Containers

a. General. The factors governing the selection of shipping containers are type of load, kinds of corrosion preventive and inner packaging used, and method of transportation to be employed.

b. Types of Loads. The type of load is determined by the weight,

size, fragility, and shape of the contents. There are three types of loads: easy, average, and difficult.

(1) *Type 1, easy loads.* Easy loads include the following:

(*a*) Articles of low or moderate density prepacked in one inner container which completely fills, supports, and adds rigidity to all surfaces of the shipping box; for example, cans or cartons packed in an inner container that completely fills the outer shipping box.

(*b*) A single article that contacts and supports all surfaces of the shipping box and has sufficient strength, even though not boxed, to withstand forces encountered in transportation and handling, but which requires the protection of a box to prevent scratching or marring. Examples are wood or metal chests, tool kits, and boxed sturdy instruments packed in a shipping box.

(*c*) Articles that are not easily damaged by shock or puncture and are durable enough to withstand the forces encountered in transportation and handling. Examples are clothing and textiles.

(2) *Type 2, average loads.* Average loads include the following:

(*a*) Moderately concentrated place-packed articles packed directly in the outer shipping box and providing support at several points on each surface of the shipping container. Examples are canned goods, books, paper, battery jars, light and medium weight cut-to-length tubing, and other place-packed articles.

(*b*) Two or more completely or partially filled packages packed into an outer shipping box and supporting all surfaces of the box. Examples are cartons containing small hardware, bolts and nuts, nails, screws, washers, electrical cords, outlet boxes, switches, fuse plugs, door knobs, breast drills, footwear, small jars, bottles, or prepackaged articles such as cosmetics, polish, toothpaste, or shaving cream.

(*c*) Glass bottles not exceeding one-half-gallon capacity, separated by partitions providing adequate protection and individually cushioned with liners and pads. Examples are bottles containing beverages, cleaning fluids, catsup, sirup, pickles, and peanut butter.

(*d*) Articles of light or medium concentration, packed in excelsior, paper wadding, or similar packing material, completely filling the box. Examples are chinaware, enamelware, aluminum ware, glassware, pottery, or molded plastics.

(3) *Type 3, difficult loads.* Difficult loads include the following:

(*a*) One or more partially filled containers packed into and completely filling an outer shipping box but not sufficiently sturdy to provide substantial support to its surfaces. Ex-

amples are partially filled cartons containing hardware, bolts, nuts, nails, screws, and washers.

(*b*) Articles of moderate concentration packed in bulk, or place-packed articles of heavy concentration, completely filling the shipping box, or loads of heavy concentration packed in excelsior, paper wadding, or similar packing material, and completely filling the box. Examples are porcelain insulators packed in bulk, firebrick, castings, heavy stampings or machine parts packed in excelsior, coiled metal tubing, or heavy metal tubing cut to length.

(*c*) Bulk (jumble-packed) shipments of small, highly concentrated articles which pack tightly and completely fill the box. Examples are small nuts and bolts, washers, nails, cotter pins, rivets, or wood screws.

(*d*) Irregular-shaped articles that do not support the inner surfaces of the shipping box or articles attached to one or more surfaces of the box, or articles that do not completely fill the box and require bracing, blocking, cushioning, or floating. Examples are adding machines, typewriters, lawn mowers, small motors, generators, machined parts, or assemblies.

(*e*) Glass bottles or jugs exceeding one-half gallon capacity, separated by partitions and cushioned with liners and pads. Examples are containers of cider, vinegar, and soda fountain sirup.

(*f*) Fragile, dangerous, or other articles that require a high degree of protection from puncture, shock, or distortion of the container. Examples are delicate scientific instruments, weighing scales, heavy mirrors, framed and glassed pictures, drugs, and explosives.

(*g*) Highly concentrated loads. Examples are bar solder, steel balls, welding rods, steel chain, or metal sheets.

(*h*) Articles of high density which partially fill the box and which may exert highly concentrated force on one or more surfaces of the box, permitting excessive shifting of the contents. Examples are well points, large gears, long heavy bolts and nuts, crank shafts, axle shafts, solid bar stock, drive shafts, automobile springs, bolts and nuts, track spikes, drop forgings, or rough castings.

40. Strapping

a. In addition to being used as reinforcement for blocking and bracing, strapping is employed as a reinforcement for exterior containers. Only tempered high tensile strapping and wire may be used for container reinforcement.

b. Each military container specification has a section or appendix devoted to closure and strapping. It is very important that the instructions contained in these publications be observed.

c. The following precautions are advisable for strapping reinforcement to boxes, wood, nailed.

(1) Use strapping of correct type conforming to the appropriate Federal specifications.

(2) Use strapping of correct size and strength as determined from tables XXXIII and XXXIV.

(3) Use correct number of straps depending upon the weight of contents and stype of shipping container.

(4) Locate strapping correctly.

(*a*) All straps should be applied at right angle to the edges of the box over which they pass and should be drawn tight so as to sink into the wood at the edges. Straps should be applied just prior to shipment whenever practicable.

(*b*) If two or more straps are used, the distance between end straps and the ends of the box should be approximately one-sixth the length of the box. The intermediate straps should be spaced equally between the end straps.

(*c*) When style 2, 2½, 3, 4, or 5 boxes are used, two or more straps should be applied girthwise. When the outside length of the box exceeds 36 inches, 3 or more straps should be applied girthwise so that the distance between straps is not more than 24 inches.

(*d*) When style 6 boxes are used, one strap should be applied lengthwise, or around the top, bottom, and end. After this strap has been applied, two additional straps should be applied girthwise.

Table XXXIII. Minimum Sizes of Flat Metal Bands for Various Weights of Boxes

Net weight of contents of box (lbs)	Dimensions of flat metal bands when different Nos. of bands are used	
	One or two bands (in.)	Three or more bands (in.)
Less than 70	⅜ x 0.015	⅜ x 0.015
70 to 125	⅜ x 0.020	⅜ x 0.020
126 to 175	½ x 0.020	½ x 0.020
176 to 250	⅝ x 0.020	⅝ x 0.020
251 to 400	¾ x 0.020	¾ x 0.020
401 to 1,000	----------	¾ x 0.023

Table XXXIV. Minimum Sizes of Round Wire for Various Weights of Boxes

Net weight of contents of box (lbs)	Size of wire when different numbers of wires are used			
	One or two bands		Three bands	
	100,000 psi tensile strength (diam in in. and gage)	140,000 psi tensile strength (diam in in. and gage)	100,000 psi tensile strength (diam in in. and gage)	140,000 psi tensile strength (diam in in. and gage)
Less than 70	0.0720 (15 gage)	0.0625 (16 gage)	0.0720 (15 gage)	0.0625 (16 gage)
70 to 125	0.0800 (14 gage)	0.0720 (15 gage)	0.0800 (14 gage)	0.0720 (15 gage)
126 to 175	0.0915 (13 gage)	0.0800 (14 gage)	0.0915 (13 gage)	0.0800 (14 gage)
176 to 250	0.0915 (13 gage)	0.0915 (13 gage)	0.0915 (13 gage)	0.0915 (13 gage)
251 to 400	0.1055 (12 gage)	0.0990 (12½ gage)	0.0915 (13 gage)	0.0915 (13 gage)
401 to 1,000			0.1055 (12 gage)	0.0990 (12½ gage)

41. Woods

a. Species. The species of wood that may be used for lumber for nailed wood boxes are classified in groups as indicated in table XXXV. When a group is specified, any species in that group may be used. Species of groups 1 and 2 may be used in combination. Species of groups 3 and 4 may also be used in combination. Species of groups 1 and 2 will not be used in combination with species of groups 3 and 4.

Table XXXV. Species of Wood

Group 1

Alder, red	Fir, California red	Pine, ponderosa (western yellow)
Aspen (popple)	Fir, grand	Pine, red (Norway)
Basswood	Fir, noble	Pine, sugar
Buckeye	Fir, silver	Pine, white
Cedar	Fir, white	Poplar, yellow
Chestnut	Magnolia	Redwood
Cottonwood	Pine, eastern white	Spruce
Cypress	Pine, jack	Willow
Fir, alpine	Pine, lodgepole	
Fir, balsam		

Group 2

Douglas fir	Larch, western	Tamarac
Hemlock	Pine, southern	

Table XXXV. Species of Wood—Continued

	Group 3	
Ash, black	Cherry	Sycamore
Ash (cabinet texture)	Elm, soft	Tupelo, water
Blackgum	Maple, soft	
	Sweetgum (red gum)	
	Group 4	
Ash, white (rough texture)	Elm, rock	Maple, hard
Beech	Hackberry	Oak
Birch	Hickory	Pecan
	Locust	

b. Group Characteristics. The above groups are set up so that each one is limited to woods with similar characteristics of importance to box design. These characteristics include density, flexural and compression strength, stiffness, shock absorption, and nail-holding power. Variations of the characteristics of woods within any one group are not great enough to interfere with their use in box design. Box designs should be based on the characteristics of each group of woods.

c. Use of Groups. In general, the density of woods increases in order from group 1 to group 4. There is the same progressive increase from group 1 to group 4 in strength, nail-holding power, and the other characteristics indicated above. Therefore, for a box of the same dimensions designed to carry a stated load under given conditions, the required thickness of boards is greatest when woods of group 1 are used and least when woods of group 4 are used. Likewise, to provide the total nail-holding power required for a box, more nails, longer nails, nails of a larger diameter, or a combination of these must be used if woods of group 3 are used instead of woods of group 4, or of group 2 instead of group 3.

d. Lumber Standards. The lumber used in the manufacture of nailed wooden boxes must meet the following standards:

(1) Lumber will be seasoned to a moisture content of not more than 18 percent nor less than 7 percent of its oven-dry weight.
(2) Pieces will be cut to length and dressed on at least one side.
(3) Pieces will be free from all defects that materially weaken them, expose the contents of the box to damage, or interfere with the prescribed fabrication or nailing.
(4) No knot will have a diameter exceeding one-third of the width of the piece.

42. Nails

a. Types of Nails. In the manufacture of wooden boxes, three types of nails are generally used: They are the cement coated standard box,

the cooler, and the sinker types. The cooler and the sinker are identical except for the head. The head of a cooler is flat on the underside, while the head of a sinker is slightly smaller and cone-shaped on the underside. The cement coated standard box nail is the same length as the cooler or the sinker but is smaller in diameter.

b. Coated Nails. Nails used in the making of boxes may be bright or cement-coated. If two boards are to be fastened together with nails and the nails clinched in the under board, bright nails may be used. If two boards are to be fastened together with nails not clinched, cement-coated nails should be used. Cement-coated nails frequently have from 50 to 100 percent more nail-holding power than bright nails of the same penny weight size.

c. Nailing.

(1) If the desired nail is not available, one size smaller shall be used and nails spaced one-fourth inch closer than is required for the size of nail substitutes (tables XXXVI, XXXVII, and XXXVIII).

(2) When the top and bottom are nailed to the sides, the nails will be spaced between 6 and 8 inches apart.

(3) When cleats are nailed to the ends of the box they shall pass through the cleat (or bottom) and be clinched not less than one-eighth inch.

Table XXXVI. Size and Weight of Cement-Coated Box Nails

Size	Length (in.)	Diameter (in.)	Head (in.)	Approximate No. per pound
(1) *Coolers.*				
4-penny	1 3/8	.0800	7/32	488
5-penny	1 5/8	.0860	15/64	364
6-penny	1 7/8	.0915	1/4	275
7-penny	2 1/8	.0990	17/64	212
8-penny	2 3/8	.1130	9/32	144
9-penny	2 5/8	.1130	9/32	127
10-penny	2 7/8	.1205	19/64	104
(2) *Corkers.*				
4-penny	1 3/8	.0860	7/32	392
6-penny	1 7/8	.0990	1/4	232
8-penny	2 3/8	.1205	9/32	129
9-penny	2 5/8	.1205	9/32	114
10-penny	2 7/8	.1350	5/16	84
12-penny	3 1/8	.1350	5/16	77
16-penny	3 3/8	.1483	11/32	59
20-penny	3 7/8	.1770	3/8	36
(3) *Sinkers.*				
4-penny	1 3/8	.0800	13/64	488
5-penny	1 5/8	.0860	7/32	364
6-penny	1 7/8	.0915	15/64	275
7-penny	2 1/8	.0990	1/4	212
8-penny	2 3/8	.1130	17/64	142

Table XXXVI. Size and Weight of Cement-Coated Box Nails—Continued

Size	Length (in.)	Diameter (in.)	Head (in.)	Approximate No. per pound
9-penny	2 5/8	.1130	17/64	130
10-penny	2 7/8	.1205	9/32	104
12-penny	3 1/8	.1350	5/16	77
16-penny	3 1/4	.1483	11/32	61
20-penny	3 3/4	.1770	3/8	37
(4) *Standard.*				
4-penny	1 3/8	.0670	13/64	710
5-penny	1 5/8	.0720	7/32	536
6-penny	1 7/8	.0860	1/4	306
7-penny	2 1/8	.0860	1/4	268
8-penny	2 3/8	.0990	17/64	186
9-penny	2 5/8	.0990	17/64	167
10-penny	2 7/8	.1130	19/64	118

Table XXXVII. Size and Weight of Bright (Uncoated) Standard Box and Common Nails

Size	Length (in.)	Diameter (in.)	Head (in.)	Approximate No. per pound
(1) *Standard.*				
4-penny	1 1/2	.0800	7/32	473
5-penny	1 3/4	.0800	7/32	406
6-penny	2	.0990	17/64	236
7-penny	2 1/4	.0990	17/64	210
8-penny	2 1/2	.1130	19/64	145
9-penny	2 3/4	.1130	19/64	132
10-penny	3	.1280	5/16	94
12-penny	3 1/4	.1280	5/16	88
(2) *Common.*				
4-penny	1 1/2	.0985		316
5-penny	1 3/4	.0985		271
6-penny	2	.113		181
7-penny	2 1/4	.113		161
8-penny	2 1/2	.131		106
9-penny	2 3/4	.131		96
10-penny	3	.1483		69
12-penny	3 1/4	.1483		63

Table XXXVII-Continued. *Size of Nails and Spacing for Nailing Top and Bottom to Sides*

Thickness of side (in.)	Group I wood	Group II wood	Group III and IV wood
Under 3/4	No nailing permitted	No nailing permitted	No nailing permitted
3/4 to 7/8	7d	6d	5d
15/16 to 1 1/16	8d	7d	

Table XXXVIII. Spacing of Nails[1]

Size of nails	Spacing[2] (in.)	
	When driven into side grain of end	When driven into end grain of end
6-penny or smaller	2	1¾
7-penny	2¼	2
8-penny	2½	2¼
9-penny	2¾	2½
10-penny	3	2¾
12-penny	3½	3
16-penny	4	3½
20-penny	4½	4

[1] Except the nailing of top and bottom of sides.

[2] The spacing of cement-coated nails fastening the sides, tops, or bottoms to the ends and cleats shall not be greater than that given in this table. When, because of small knotholes or checks in the nailing end, it is necessary to exceed this spacing, the distance between any two adjacent nails shall not be greater than 1½ times the spacing given in this table.

43. Nails and Lumber for Types of Loads and Groups of Wood

Information on nails and lumber for boxes for different types of loads and groups of woods is given in table XXXIX.

Table XXXIX. Nails and Lumber for Different Types of Loads and Groups of Woods

a. Type 1 (Easy) and Type 2 (Average) Loads.

(1) *Groups 1 and 2 woods.*

Weight of contents of box (lbs)	Style of box*	Minimum thickness of sides, tops, and bottoms of box (in.)	Minimum thickness of ends of box (in.)	Minimum thickness and width of cleats (in.)	Size of nail for nailing sides, tops, and bottoms to ends and cleats** (penny)	
					Group 1 woods	Group 2 woods
To 50	4 or 5	3/8	5/8	5/8 x 1¾	6	5
51 to 100	4 or 5	7/16	3/4	3/4 x 2¼	7	6
101 to 250	4 or 5	9/16	3/4	3/4 x 2¼	8	7
101 to 250	2, 2½ or 3	9/16	5/8	5/8 x 2¼	8	7
251 to 400	4 or 5	11/16	25/32	25/32 x 2⅝	9	8
251 to 400	2, 2½ or 3	11/16	3/4	3/4 x 2⅝	9	8
401 to 600	2, 2½ or 3	25/32	25/32	25/32 x 2⅝	9	8

See footnotes at end of table, p. 96.

Table XXXIX. Nails and Lumber for Different Types of Loads and Groups of Woods—Continued

(2) *Groups 3 and 4 woods.*

Weight of contents of box (lbs)	style of box*	Minimum thickness of sides, tops, and bottoms of box (in.)	Minimum thickness of ends of box (in.)	Minimum thickness and width of cleats (in.)	Size of nail for nailing sides, tops, and bottoms to ends and cleats** (penny)	
					Group 3 woods	Group 4 woods
To 100	4 or 5	7/16	5/8	5/8 x 1 3/4	5	5
To 100	2, 2 1/2 or 3	7/16	5/8	5/8 x 1 3/4	5	5
101 to 250	4 or 5	1/2	3/4	3/4 x 2 1/4	6	5
101 to 250	2, 2 1/2 or 3	1/2	5/8	5/8 x 1 3/4	5	5
251 to 400	4 or 5	5/8	13/16	13/16 x 2 3/4	7	6
251 to 400	2, 2 1/2 or 3	5/8	3/4	3/4 x 2 3/4	6	5
401 to 600	2, 2 1/2 or 3	11/16	13/16	13/16 x 2 3/4	7	6
601 to 800	2, 2 1/2 or 3	3/4	13/16	13/16 x 2 3/4	8	7
801 to 1000	2, 2 1/2 or 3	7/8	1 1/16	1 1/16 x 3 3/8	9	8

b. Type 3 (difficult) Loads.

(1) *Groups 1 and 2 woods.*

Weight of contents of box (lbs)	Style of box*	Minimum thickness of sides, tops, and bottoms of box (in.)	Minimum thickness of ends of box (in.)	Minimum thickness and width of cleats (in.)	Size of nail for nailing sides, tops, and bottoms to ends and cleats** (penny)	
					Group 1 woods	Group 2 woods
To 100	4 or 5	1/2	3/4	3/4 x 2 1/4	8	7
To 100	2, 2 1/2 or 3	1/2	5/8	5/8 x 2 1/4	7	6
101 to 250	4 or 5	5/8	25/32	25/32 x 2 5/8	8	7
101 to 250	2, 2 1/2 or 3	5/8	3/4	3/4 x 2 1/4	8	7
251 to 400	4 or 5	3/4	1 1/16	1 1/16 x 3 1/4	10	9
251 to 400	2, 2 1/2 or 3	3/4	3/4	1 1/16 x 3 1/4	9	8
401 to 600	2, 2 1/2 or 3	25/32	25/32	1 1/16 x 3 1/4	9	8
601 to 800	2, 2 1/2 or 3	13/16	1 1/16	1 1/16 x 3 1/4	10	9
801 to 1000	2, 2 1/2 or 3	1 1/16	1 5/16	1 5/16 x 4 1/8	12	12

See footnotes at end of table, p. 96.

Table XXXIX. Nails and Lumber for Different Types of Loads and Groups of Woods—Continued

(2) *Groups 3 and 4 woods.*

Weight of contents of box (lbs)	Style of box*	Minimum thickness of sides, tops, and bottoms of box (in.)	Minimum thickness of ends of box (in.)	Minimum thickness and width of cleats (in.)	Size of nail for nailing sides, tops, and bottoms to ends and cleats** (penny)	
					Group 3 woods	Group 4 woods
To 50	4 or 5	5/16	5/8	5/8 x 1 3/4	5	5
51 to 100	4 or 5	3/8	5/8	5/8 x 1 3/4	5	5
101 to 250	4 or 5	1/2	11/16	11/16 x 2 1/4	6	5
101 to 250	2, 2 1/2 or 3	1/2	5/8	5/8 x 2 1/4	6	5
251 to 400	4 or 5	9/16	3/4	3/4 x 2 1/4	6	6
251 to 400	2, 2 1/2 or 3	9/16	11/16	11/16 x 2 1/4	6	6
401 to 600	2, 2 1/2 or 3	5/8	3/4	3/4 x 2 1/4	6	6

* When minimum thickness shown is exceeded, nail sizes will be increased.

** Where depth of cleated-style box is 5 inches or less, each side and each end will be made from one piece, and the thickness of ends will not be less than the combined thickness of the end and cleat specified above.

CHAPTER 7
TRANSPORTATION

44. Motor Transportation

Information on motor transportation is given in tables XL and XLI.

Table XL. Vehicle Capacities for Cargo and Men and Equipment

Vehicle	Cargo[a]		Men and equipment[a]
	Poor, rough road	Good, hard surfaced road	
Truck, ¼-ton	----------	----------	[b]3
Truck, ¾-ton	----------	----------	[b]8
Truck, 1½-ton	----------	----------	[b]15
Truck, 2½-ton 6 x 6 LWB:			
With trailer	3½ tons	5 tons	25
Without trailer	2½ tons	5 tons	25
Truck, 2½-ton 6 x 6 SWB:			
With trailer	3½ tons	5 tons	18
Without trailer	2½ tons	5 tons	18
Truck, 2½-ton 6 x 6 COE, 15- or 17-foot body (no trailer).	2½ tons	5 tons	30
Truck-tractor, 5-ton, w/10-ton semitrailer	(°)	10 tons	40
Truck-tractor, 5-ton, w/2,000-gallon tank, semitrailer.	(°)	2,000 gallons	(°)

[a] Trucks carrying either cargo or men and equipment—not both.
[b] Represents men, excluding driver.
[c] Not generally used.

Table XLI. Pertinent Data for Army Vehicles

Vehicle	Weight: (1) Net (2) Payload (3) Gross	Shipping Dimensions: Length (in.)	Width (in.)	Height (in.)	Cubic feet	Square feet	Capacity: (1) Fuel (2) Crankcase	Miles per gallon	Crusing range (miles)
Motorcycle, solo, chain driven	(1) 537 (2) 200 (3) 737	88	36¼	41	78	80	(1) 3½ gal. (2) 3 qt.	42	147
Automobile, sedan, light, 5-passenger	(1) 3,275 (2) 775 (3) 4,050	195⅞	72¾	69⅜	575	99	(1) 16 gal. (2) 6 qt.	17	270
Automobile, sedan, medium, 5-passenger.	(1) 3,700 (2) 850 (3) 4,550	208½	76⅛	63½	583	110	(1) 17 gal. (2) 5½ qt.	16	270
Truck, utility, ¼-ton, 4 x 4, M38	(1) 2,625 (2) 1,200 (3) 3,825	133	62	52	266	57	(1) 13 gal. (2) 5 qt.	17	220
Truck, cargo, ¾-ton, 4 x 4, M37	(1) 5,700 (2) 2,000 (3) 7,700	189	74	92	503	95	(1) 24 gal. (2) 4 qt.	9	215
Truck, cargo, 5-ton, 6 x 6, M41, w/winch.	(1) 19,835 (2) 10,000 (3) 30,185	309¾	96	111⅛	1,912	206	(1) 70 gal. (2) 18 qt.	4	280
Truck, medium wrecker, 4-ton, 6 x 6	(3) 21,700	291⅝	99½	116	1,946	202	(1) 60 gal. (2) 16 qt.	3	180
Truck, tractor, 5- to 6-ton, 4 x 4	(1) 11,950 (2) 8,270 (3) 20,220	203	94	109	1,035	132	(1) 62 gal. (2) 14 qt.	4.5	280
Trailer, cargo, ¼-ton, 2-wheel	(1) 550 (2) 500 (3) 1,050	78	56	42	116	42			

Trailer, cargo, 1-ton, 2-wheel	(1) Steel, 1,490 Wood, 1,300 (2) 2,000 (3) Steel, 3,490 Wood, 3,300	145½	71⅛	73	438	72			
Trailer, tank, water, 1-ton, 2-wheel, 250-gal.	(1) Aluminum, 1,350 Steel, 1,500 (2) 2,000 (3) Aluminum, 3,350 Steel, 3,500	136½	71⅛	70	347	68			
Truck, cargo, 1½-ton, 6 x 6	(1) 7,545 (2) 3,000 (3) 10,545	224	86	104½	1,165	138	(1) 30 gal. (2) 5 qt.	9	270
Truck, cargo, 2½-ton, 6 x 6, M135	(1) 12,330 (2) 5,000 (3) 17,330	267	88	105	1,428	163	(1) 56 gal. (2) 11 qt.	4	224

45. Rail Transportation

Information on rail transportation is given in tables XLII through XLVII.

Table XLII. Capacities of Standard United States Military Railway Cars

Type of car	Gage	Capacity[1] (tons)	Weight empty (tons)	Inside dimensions		
				Length	Width	Height
Box	4′8½″	20	9	23′9½″	7′7½″	6′5″
Box	3′3⅜″	30	15	34′6″	7′1″	6′1″
Box	3′6″	30	15	34′6″	7′1″	6′1″
Box	4′8½″	40	20	39′9″	8′0″	6′9″
Gondola, high-side	4′8½″	20	8	23′9½″	7′6″	[2]4′0″
Gondola, high-side	3′6″	30	10	34′6″	6′11½″	[2]4′0″
Gondola, low-side	3′3⅜″	30	9	34′6″	6′11″	[2]1′6″
Gondola, low-side	4′8½″	40	18	40′6½″	7′6″	[2]1′6″
Flat	4′8½″	56	17.5	40′9″	8′5″	
Tank, 9,900-gallon	4′8½″	40	20	37′2″	[3]6′9″	
Tank, 5,000-gallon	3′6″	30	16	27′6″	[3]5′6″	
Refrigerator	4′8½″	35	21	32′8″	6′11″	6′6″

[1] Capacity for personnel may be computed on a basis of 8 square feet per man and equipment for those cars suitable for this purpose.

[2] Height of sides.

[3] Diameter.

Table XLIII. Data Pertaining to United States Passenger Cars

Car	Length (ft)	No. of sections	Maximum seating		Maximum sleeping, 2 men per berth	Sleeping capacity	
			2 men per double seat[1]	3 men per 2 double seats[1]		3 men per section	1 man per berth
Day coach[2]	65–75	None	60–70	45–52	None	None	None
Tourist pullman	65–75	13–16	52–64	39–48	52–64	39–48	26–32
Standard pullman[3]	65–80	12–16	53–64	40–48	53–64	40–48	27–32

[1] Seat having capacity for two men.

[2] Limited number of steel coaches 70 feet long or over available.

[3] Twelve sections and drawing room or 16 sections and no drawing room.

*Table XLIV. Data on United States Freight Cars**

Type of car	Capacity		Weight empty (tons)	Inside dimensions		
	Tons	Cubic feet		Length	Width	Height
Box	30	2,750	18	36′	8′6″	9′
Box	40	3,100	20	40′6″	8′6″	9′

(*a*) Hold	305	637	1,284	1,578	401	1,646	856
(*b*) Between decks	855	1,596	2,504	2,506	1,454	965	627
(*c*) Deep tanks					953	298	

47. Aerial Supply

The Quartermaster General has the responsibility for issuing and maintaining the parachutes, aerial delivery containers, and heavy-drop kits used in phase I of an airborne assault and in resupply operations. To fulfill this responsibility, a quartermaster parachute supply and maintenance company is included in the organization of each airborne division. In addition, a quartermaster aerial supply company and a quartermaster air equipment repair and depot company may be attached to a headquarters and headquarters detachment, quartermaster battalion.

a. Aerial Delivery Methods. The methods used for aerial delivery of supplies and equipment by parachute may vary with the type of aircraft available, the scope of the supply operation, and the type of equipment to be dropped.

(1) *Heavy cargo extraction system.* The heavy cargo extraction method is designed to deliver ready-to-use equipment and supplies. The system requires heavy-drop techniques using special equipment to contain the load, extract it from the open rear of cargo aircraft in flight, suspend it during the drop, and protect it from damage when it lands. To accomplish these objectives, the load is lashed to a heavy platform and padded against shock. The parachutes are attached, and the load is positioned and tied down in the cargo compartment of the aircraft. As the aircraft approaches the drop zone, all tie-downs are released with the exception of one safety strap which secures the load until the drop is made. Over the drop zone, a pilot parachute is released, deploying an extraction parachute. The extraction parachute, in turn, cuts the one remaining strap, pulls the load out of the aircraft, and deploys the main cargo parachutes, which suspend the load during the descent. When the load lands, a release assembly frees the cargo parachutes. Then, with the parachutes released, the equipment may be derigged and put into action within a few minutes after landing.

(2) *Door-load delivery.* The door-load delivery system is the simplest form of aerial delivery and requires the least preparation, but it is limited to small packages and small supply missions. The packages are placed in the doorway and pushed from the aircraft over the drop zone. The parachute static line can be attached to an anchor line cable or a tie-down ring near the door of the aircraft. The door-load system is adaptable to any type of aircraft that can accommodate the load and provide an opening for ejection.

(3) *Pararack delivery.* The pararack delivery system is an adaptation of the bomb rack system, employing release stations and bomb shackles. Aerial delivery containers can be attached to the bomb shackles and released by the pilot. It may be used

for small supply operations employing transport-type aircraft or light army aircraft fitted with bomb release stations under the fuselage or wings.

(4) *Monorail delivery.* The purpose of monorail delivery is to deliver with the assaulting airborne troops up to 10,000 pounds of rations, ammunition, weapons, and other items needed by combat troops. It is normally used in C–119 aircraft. The system consists of a single rail located at the top center of the fuselage running the full length of the cargo compartment. To the rail is attached trolleys. Each of these trolleys carry a 500-pound bundle or container. The trolleys are pulled along the rail by a cable. Silver-colored metal balls make it possible for the cable to propel the trolleys along the rail. There is a parachute attached to the container and from the parachute a static line is attached to the anchor line cable. At the forward part of the cargo compartment, in the floor, are paratainer doors. The containers are pulled to this point where they are released from the trolleys and fall through the paratainer doors. A static line deploys the parachutes. The entire system requires 7½ seconds to complete a drop of 20 bundles or containers. This system is for use during the assault phase of an airborne operation. It is not normally used for large-scale aerial resupply.

(5) *Gravity system.* The gravity (wheeled conveyor jettison) system is used to deliver the A22 aerial delivery container. Roller skate conveyors are placed on the floor of the aircraft and several A22 containers, attached to plywood skids, are placed on the conveyors. A tie-down assembly consisting of three straps holds the last container on the aircraft. All other containers rest against the last container; when the last container is freed, all containers roll from the aircraft. With the aircraft flying in a tail-down attitude and the restraining straps removed or cut from the rear of the load, gravity does all the work and the containers roll from the aircraft. To cut the restraining straps, a system of parachutes and deployment weight is used. The deployment weight is attached outside of the aircraft at the extreme rear. The pilot releases this weight as he reaches the drop zone. The weight pulls out a pilot chute which in turn pulls out a release parachute. The release parachute has a release line with three knives attached. The knives rest against one of each of the three restraining straps. When pressure is applied to the release line by the release parachute, it pulls on the knives, cutting the restraining straps, freeing the load, and allowing gravity to go to work.

b. Types of Aircraft, Cargo Parachutes, Aerial Delivery Containers, and Heavy-Drop Kits. Parachute delivery of supplies and equipment will usually employ C–119 type aircraft to facilitate ejection or extraction of

loads through the open rear of the cargo compartment. Tables L through LIII give data on types of aircraft, cargo parachutes, aerial delivery containers, and heavy-drop kits.

Table L. Aircraft Data

Aircraft	Basic[1]	Maximum takeoff[2]	Maximum landing	Allowable cargo (1,000-mile radius)
C–46	32,000	50,000	45,000	13,000
C–47	17,000	28,000	26,000	5,000
C–54	40,500	72,000	66,000	26,000
C–74	85,000	165,000	160,000	49,910
C–82	33,600	54,000	50,000	10,100
C–97	78,000	148,000	128,000	40,000
C–119	42,500	72,600	59,900	17,000
C–123	31,000	54,000	59,300	14,500
C–124	100,000	175,000	160,000	45,000

[1] Weight of plane without fuel, crew, or cargo.

[2] Maximum takeoff weight is the weight estimated within the confines of (1) load and fuel space limitations and (2) minimum practical strength and performance requirements.

Table LI. Cargo Parachute Data

Type	Diameter (ft)	Load capacity (lbs)	Use	Packed weight (lbs)	Cubage (cu ft)
G–1A	24	300	A–4, A–5, A–6.	25	1
G–13	32 (nominal)	500	A–7A, A–21 containers.	45	2
G–12	64	2,200	A–22 containers.	126	4
G–11A	100	3,500	Heavy drop.	250	10

Table LII. Aerial Delivery Container Data

Type	Capacity (lbs)	Delivery system	Type loads	Container weight (lbs)
A–4	200	Door-load, pararack, monorail.	Medical supplies, rations, clothing, miscellaneous supplies.	27
A–5	300	Door-load, pararack, monorail.	Weapons, ammunition.	43
A–6	300	Door-load, pararack, monorail.	Medical supplies, signal supplies, rations.	17
A–7A	500	Door-load, monorail, pararack.	Ammunition, water cans, rations, fuel drums.	8
A–21	500	Door-load, monorail.	Weapons, ammunition, rations.	31
A–22	2,200	Gravity (wheeled-conveyor jettison system).	Rations, ammunition, petroleum, oil and lubricants, water.	58

Table LIII. Heavy-Drop Kit Data

Aerial delivery kit	No. of C–11A parachutes	Length of platform (ft)	Total weight (kit and equipment, rigged) (lbs)
¼-ton truck	2 G–11A's or 3 G–12's	11	4,221
¾-ton truck	2	15	7,732
2½-ton truck	4	22	15,667
105-mm howitzer	2	15	6,535
40-mm AA gun	2	15	7,485
M55 gun (trailer mount)	2	11	5,052
M29C carrier	2	15	6,895
6,000-lb. load-bearing platform (miscellaneous loads).*	1, 2, or 3	12	3,500 to 10,000

* All information on this kit depends upon the type load and/or equipment and supplies loaded on the platform.

CHAPTER 8
RECOVERY AND DISPOSITION ACTIVITIES

48. Military Cemeteries

a. Size. The size of military cemeteries is not fixed but is dependent on requirements. An acre of average land (43,560 sq ft) will accommodate approximately 6 standard plots (5,772 sq ft per plot), providing space for 864 grave sites, including aisle and border requirements.

b. Grave Site Requirements.

(1) *Plot.* A plot consists of 12 rows of 12 graves each. Linear measurements are 52 feet wide and 111 feet from front to rear. A 12½-foot aisle is maintained between the front and rear of adjoining plots, an 11-foot aisle is maintained between the lateral borders of adjoining plots.

(2) *Row.* A row consists of 12 graves. Linear measurements are 52 feet wide and 9½ feet from front to rear.

(3) *Grave.* A grave is dug 6½ feet long, 2½ feet wide, and 3½ feet deep. Intervals between graves are 2 feet laterally from the edges of adjoining graves and 3 feet longitudinally between the front and rear of adjoining graves. Under normal conditions, one man can dig a grave in 2 to 3 hours.

49. Mass Burials

The grave site for a mass burial will contain no individual graves. It will consist, rather, of a varied number of rows. Each row will be 3½ feet deep and can be any length, provided it is straight and contains no obstructed graves. If, in digging a row, an obstruction is encountered, that row will be ended and new row started. Remains will be buried shoulder to shoulder in the row, with no space between remains.

CHAPTER 9

MEASUREMENTS, CONVERSIONS, AND EQUIVALENTS

50. Measurements

Tables LIV through LXI give information on measurements.

Table LIV. Linear Measure

16½ feet	=	1 rod
5½ yards	=	1 rod
320 rods	=	1 mile
1,760 yards	=	1 mile
5,280 feet	=	1 mile

Table LV. Square Measure

144 square inches	=	1 square foot
9 square feet	=	1 square yard
4,840 square yards	=	1 acre
70 yards square	=	1 acre (approx)
43,560 square feet	=	1 acre
640 acres	=	1 square mile
272¼ square feet	=	1 square rod

Table LVI. Cubic Measure

1,728 cubic inches	=	1 cubic foot
27 cubic feet	=	1 cubic yard

Table LVII. Nautical Measure

6 feet	=	1 fathom
100 fathoms	=	1 cable length (ordinary)
120 fathoms	=	1 cable length (U. S. Navy)
6,080.2 feet	=	1 nautical mile

Table LVIII. Dry Measure

1 pint	=	33.6 cubic inches
2 pints	=	1 quart
1 quart	=	67.2 cubic inches
8 quarts	=	1 peck
1 peck	=	537.6 cubic inches
4 pecks	=	1 bushel
1 bushel	=	2,150.42 cubic inches

Table LIX. Fluid Measure

16 fluid ounces (U. S. A.)	=	1 pint
20 fluid ounces (Britain)	=	1 pint (British)
2 pints	=	1 quart
4 quarts	=	1 gallon
1 gallon	=	8½ pounds (approx)
1 pint	=	4 gills

Table LX. Measurement of Surfaces and Solids

Circumference of a circle	=	Diameter times 3.1416
Area of a triangle	=	Base times altitude divided by 2.
Area of a square or an oblong	=	Length times breadth.
Area of a circle	=	Square of the diameter times .7854. or Square of the radius times 3.1416.
Area of the sector of a circle	=	Length of the arc times the radius divided by 2.
Area of any right-lined figure of four or more unequal sides	=	Division of the figure into triangles, finding of the area of each triangle, and adding of the areas.
Area of an ellipse	=	Long axis times the short axis times .7854.
Surface of a cone or a pyramid	=	One-half of slant height times perimeter of base plus area of base.
Surface of a cube	=	Sum of areas of all the sides.
Surface of a sphere	=	Square of the diameter times 3.1416.
Cubic content of a prism or cylinder	=	Area of the base times the height.
Cubic content of a cone or a pyramid	=	1/3 (area of base times altitude).
Surface of a prism or a cylinder	=	Area of 2 ends plus (length times perimeter).
Cubic content of a cube	=	Length times breadth times depth.
Cubic content of a sphere	=	Cube of the diameter times .5236.

Table LXI. Weights and Measures of Various Nations

Country	Weight or measure	American equivalent
Argentina	Arroba	25.32 lbs
	Baril	20.077 gals.
	Cuadra	4.2 acres

Tons, register	100	Cubic feet

52. Equivalents

Table LXXI gives information on shipping equivalents.

Table LXXI. Shipping Equivalents

Weight	Equivalent
Average short ton of military supplies with stowage.	2.2 ship (measurement) tons
Average short ton of military supplies without stowage.	1.9 ship (measurement) tons
Average long ton of military supplies with stowage.	2.464 ship (measurement) tons
Ship (measurement) tonnage	$\frac{\text{Bale cubic capacity}}{40}$
Deadweight tonnage	.85 ship (measurement) tonnage
Effective deadweight tonnage	.80 deadweight tonnage
Deadweight tonnage	1.5 gross registered tonnage
Gross tonnage	.6 deadweight tonnage*
Net tonnage	.4 deadweight tonnage*

* Approximate relation of freight ships of 10,000 deadweight tons.

53. Decimal Equivalents of Fractions

Table LXXII contains information on decimal equivalents of fractions.
